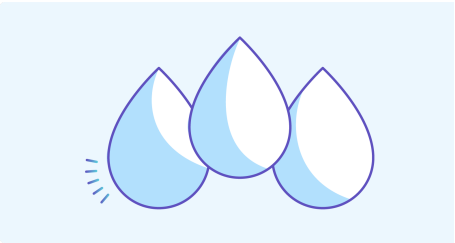
Foundations

Created by Davyd Geyl, last modified by Hillary Purssey on 18 Jan 2021

The fundamental and reusable building blocks of our design system. These are involved in the creation of all user interface elements.

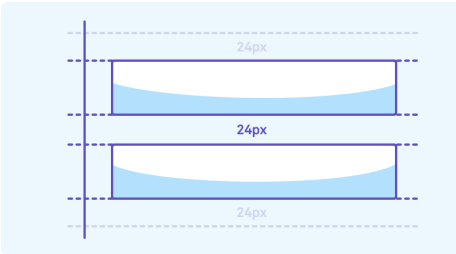


Colour

Colour brings our designs to life. Our use of colour is versatile and used to express emotion & tone, as well as place emphasis and create associations. Colour should always be used in meaningful and intentional ways to create patterns and visual cues for everyone.

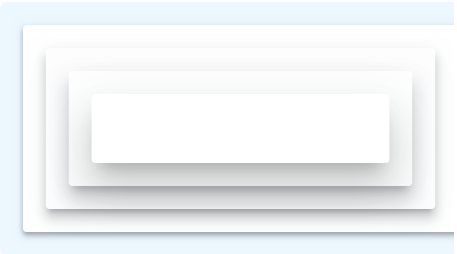
Fonts

Font refers to the size, weight and style of a typeface. Fonts are a foundational pattern in the design system and are not intended to be used directly. Instead refer to Text Styles to understand how to use within your design and development.



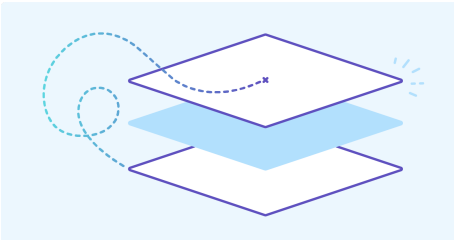
Spacing

Use the spacing scale when designing components. The spacing scale is based on multiples of 8 with 2 exceptions; a 4pt half step and a 12pt step. For web, the spacing scale can be applied to `margin` or `padding` properties.



Shadow

Shadows provide cues about depth, direction of movement, and surface edges. A surface's shadow is determined by its position on the z-axis and it's relationship to other surfaces.

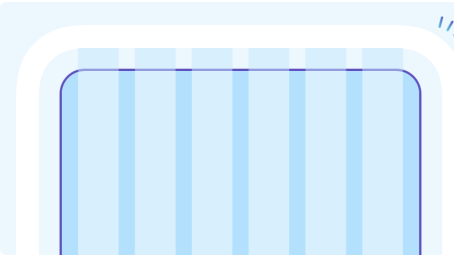


Materials

Materials are the base colours or 'screen' elements that changes in a dark and light environment dependent on the depth. Materials are used to indicate surfaces.

Icons

Icons are symbols that provide visual representation and communicate function or intent in a universal way. They can be instantly recognisable by using monochromatic images and simplified form.



Grid

A grid is a framework of columns and rows. It helps to lead the eye and comprehend content. It is responsive and scrolls vertically.
