- React Playground

Usage Guidelines

Breadcrumbs are represented as a trail of links, typically anchored to the top left of a page or container.

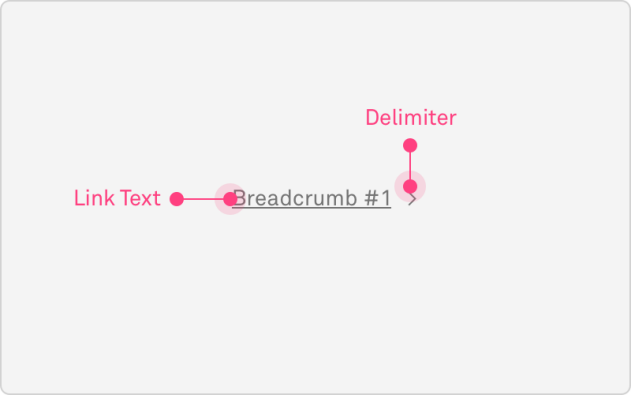
When to use Breadcrumbs:

- When the user has navigated to a sub page of an application on a website or application. It should display the parent links of the current page.
- When users must navigate through a complex site or product.
- To track hierarchical navigation.

When not to use Breadcrumbs:

- On the root level page of a website or application.

Anatomy



Best Practices

- **Use the full page title as the navigation title.**
  The breadcrumb link text should be the primary heading or title of the page that it is linking to
- **The position of Breadcrumbs should not move as the user navigates through different pages.**

Accessibility Considerations

Able's Breadcrumb Pattern follows the ARIA 1.2 Breadcrumb Design Pattern

As Breadcrumbs are simply an ordered row of links, all the WCAG 2.1 Success Criteria that apply for inline links also apply for this pattern. In addition, the following Success Criteria is also met:

1.3.1 Info and Relationships

- Links are marked up using an ordered list
- Breadcrumb pattern is wrapped in a <nav> element labelled "Breadcrumb" that identifies the structure and makes it a navigation landmark so that it is easy to locate using assistive technology, such as screen readers.

Keyboard

- Users must be able to navigate to and select each link using the keyboard alone.
- A clear visible indicator should also be present when a link has focus

Interaction	Keystrokes
Navigating	TAB moves keyboard focus to each breadcrumb link
Activation	ENTER activates the link

Screen Reader

Screen reader behaviour and the ordering of announcements will vary depending on the platform/browser/screen reader combinations being used.

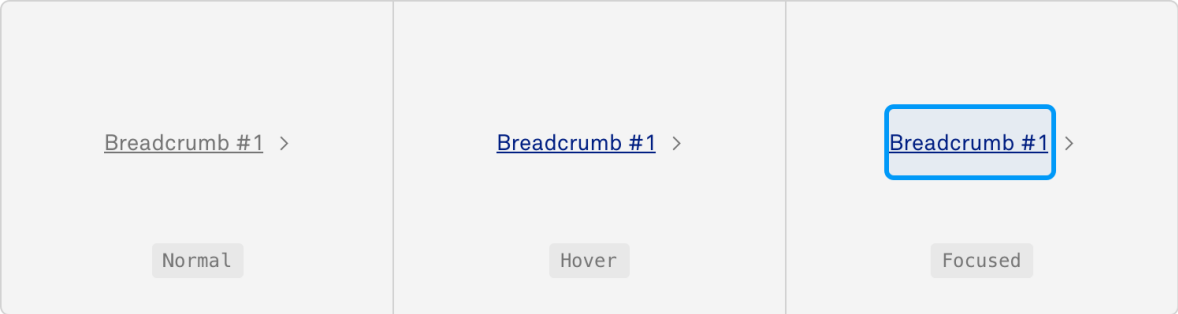
On screen reader focus announcements include:

- The **name** of the link *(full support)*
- The **role** ie "Link" *(full support)*
- The **number of items** in the list *(partial support depending on screen reader)*
- The **region** or **landmark** ie "Breadcrumb navigation" *(partial support depending on screen reader)*
- Whether the link is also the **current page** if applicable *(partial support depending on screen reader)*

Supported States

There are 3 unique states — each communicates the state of Breadcrumb as users interact with it.
Find out more details on the different states, see Interaction States.

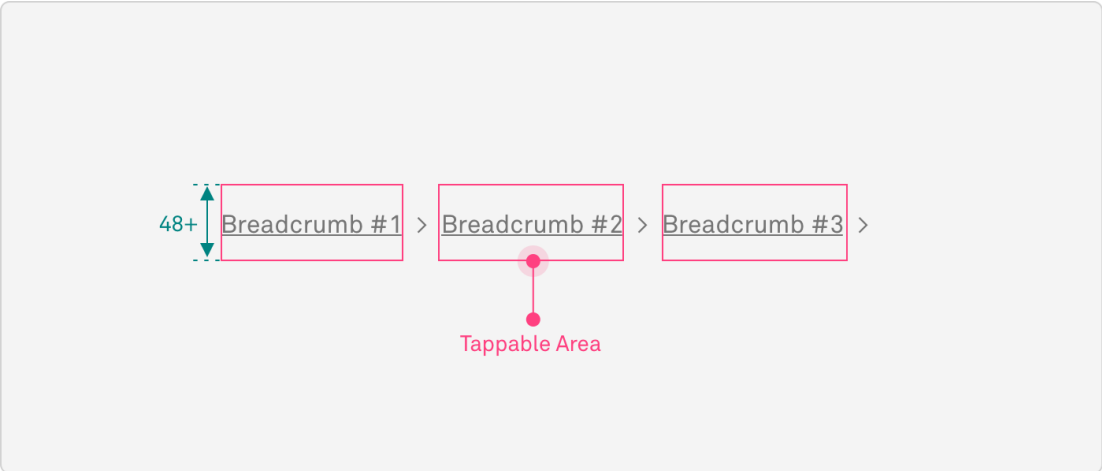
1. **Normal**
2. **Hover**
3. **Focused**



Keep in mind:

- '*Focused state*' is triggered by mouse click or keyboard navigation.

Tappable Area



Each breadcrumb item has a minimum height of 48px that allows users to easily navigate back to their previous page.
