Button Group Sequence is used to provide sequential access so users can traverse forward or backward in components or flows.

This complex pattern inherits and extends Action Button.

Specs

- Action Button (Web)

UI Playground

- Web Playground
- React Playground

Usage Guidelines (for Designers)

When to use Sequence:

When guiding a user backward and forward in a flow or component in a sequential order.

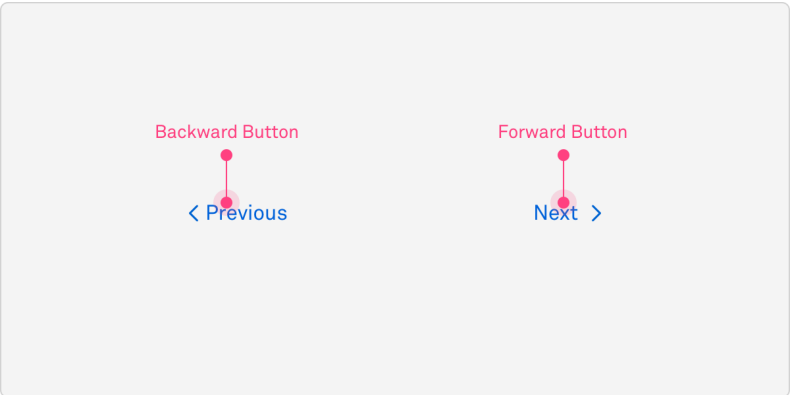
Flows or components which can make use of Sequence:

- Onboarding flows
- Multi-step forms flows
- Navigating between months or years on a time-series chart
- Pagination
- Carousel

Usage Guidelines (for Developers)

- The keyboard interaction for the Forward Button and Backward Button should always be sequential.
- While it's feasible to place elements between the two buttons, we recommend that you do not place any interactive elements. This will maintain the TAB order.
    - The one exception to this rule is a pagination component. In pagination, the interactive elements add value to the Forward and Backward Buttons.

Anatomy

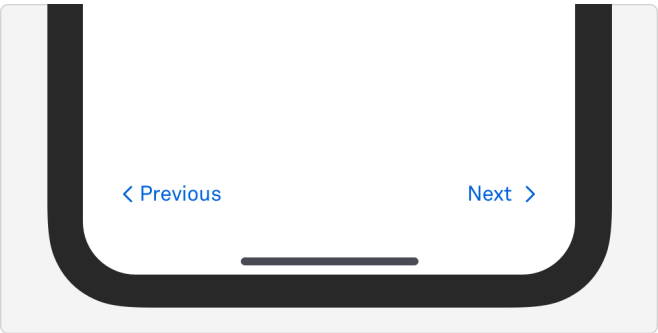


Variants

There are 3 available variants to choose from. Use the variant that is most appropriate for the component or flow you're designing.

Default

This complex pattern extends Action Button Low Emphasis, by including iconChevronRight in place of the Low Emphasis arrow.



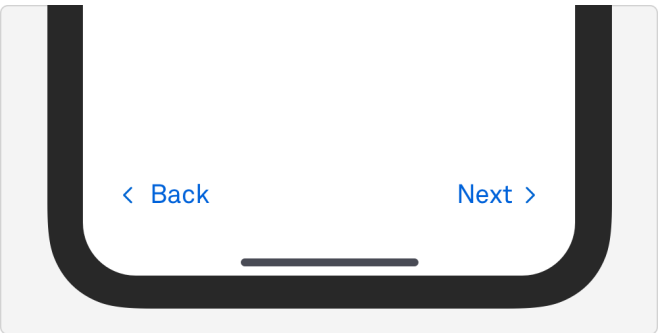
Usage recommendations:

To be used in any in-page-component which uses sequential access. Examples:

- Moving between months or years in a component which has a date range
- An onboarding flow within a modal
- As additional affordance for swiping gestures in carousels

Full

This complex pattern extends Action Button Low Emphasis Big, by including iconChevronRight in place of the Low Emphasis arrow.



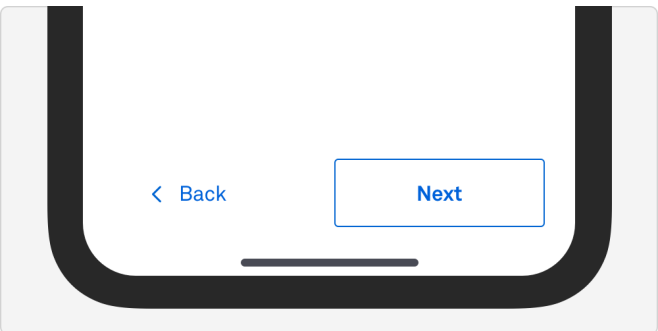
Usage recommendations:

To be used in any large or full-screen component. Example:

- Full screen onboarding flows

Form

This complex pattern extends Action Button Low Emphasis, Medium Emphasis and High Emphasis.



Usage recommendations:

Only to be used on multi-step forms. Example:

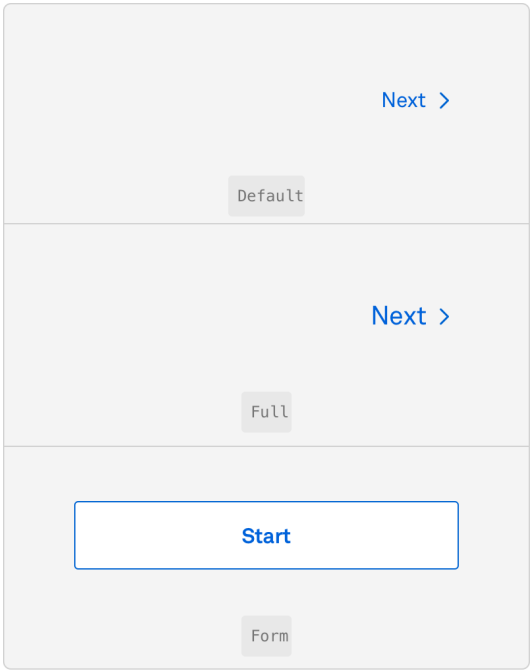
- Checkout pages
- Sign-up pages

Supported States

There are 3 supported states for each of the Button Group Sequence variants.

1. Start
2. Normal
3. End

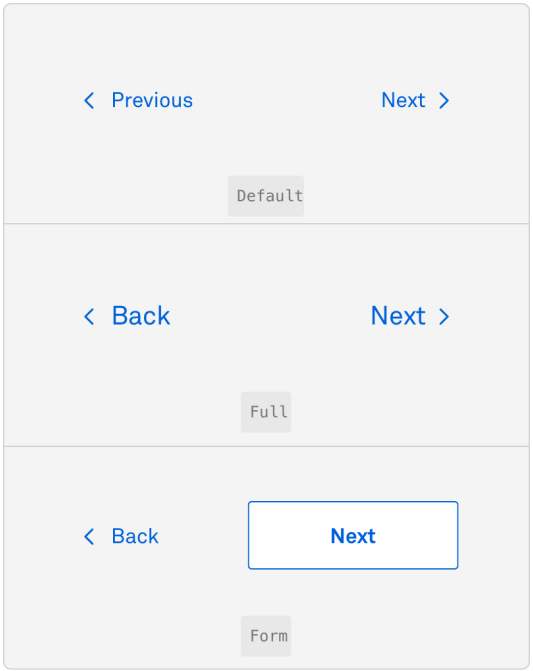
Start **Normal** **End**



Viewport XS+SM shown.

The Start state is used to signal the beginning or first step in a flow.

- It **always** has a Forward Button.
- It **never** has a Backward Button.



Viewport XS+SM shown.

This is the default state, and is used to traverse forward or backward.

- It **always** has a Forward Button.
- It **always** has a Backward Button.

Viewport XS+SM shown.

The End state is used to signal the end of a back button.

- It **usually** has a Forward Button.
- It **always** has a Backward Button.

Flow Types

Sequence can be used in different types of flows. However the Button Label content only applies to certain Flow Types.

- **Form**
  Dedicated to multi-step forms, they have multiple pages which the user must complete in order to submit the form.
- **Historic**
  This is defined by moving backwards and forwards in time. It has a beginning, middle and end. e.g. A calendar
- **Chain**
  A sequence of items of the same type. There is a dedicated first item and last item. It is used predominately in a flow which the user must move through to complete. e.g. An onboarding tour
- **Loop**
  This has no obvious first part or last part of the flow, and is reserved for slideshow-style carousels.
  Actioning the Forward Button on the last item will present the first item. Similarly, actioning the Backward Button on the first item will present the last item.

Content Guidelines

Label Keywords

To provide clear labelling for the user, we recommend using these keywords for the button labels:

- Next
- Continue
- Back
- Previous
- Done

It may be beneficial to include verbose labelling to give additional context to the user, e.g. "Back to contact details". In each of these instances, use the **keyword as the first word** in the label.

> ⚠ The "Back" keyword can be interpreted to have the same functionality as the browser's back button. For this reason, we recommend only using the "Back" label when traversing to a previous form page (Form Variant), or full page item (Full Variant).

Label Pairing

Flow Type	Backward Button Label options	Forward Button Label options	Available Variants
Form	• Back • Back to <form page name>	• Next • Continue to <form page name> • <Form Action*>	**Form**
Historic	• Previous	• Next	**Default**
Chain	• Previous	• Next • Continue to <page name> • Done	**Default**

> ⓘ *** Form Action**
> The Label content shoul
> completed form. Examp
>
> - In checkout flow,
> could be labelled
> - In a feedback flo
> should be labelle

	• Back • Back to <page name>	• Next • Next to <page name> • Done (last step only)	**Full**
Loop	• Previous	• Next	**Default**

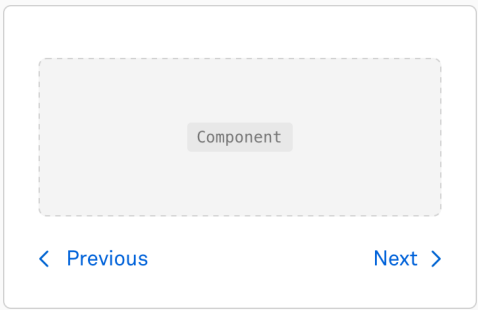
Best Practices

- **Buttons should always be enabled.**
  Do not make the Forward or Backward Button disabled. See why we don't support disabled state.
- **The position of the sequence can vary depending on what type of component it's supporting.**
  Sequence can be used below a component. If the component is complex or takes up a large vertical portion of the screen, it can be placed above **and** below the component. However this is dependent on the variation you use. E.g. Sequence Form and Sequence Full must be always be placed below.

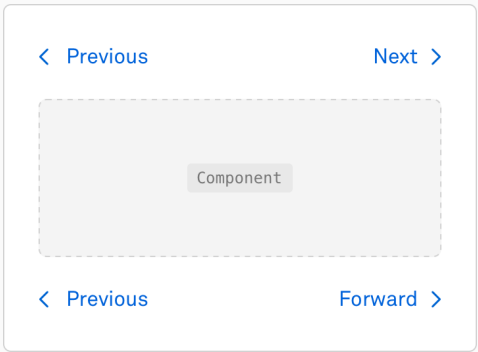
Default

Do.

Always place the Default variant below the component

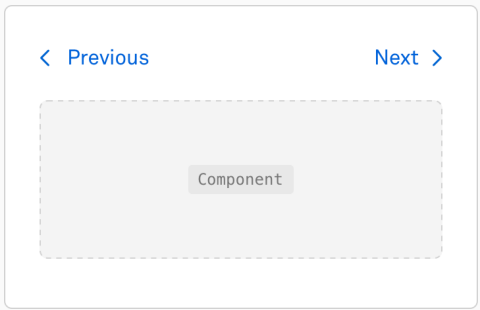


If the component is complex or takes up a large vertical portion of the screen, place above and below

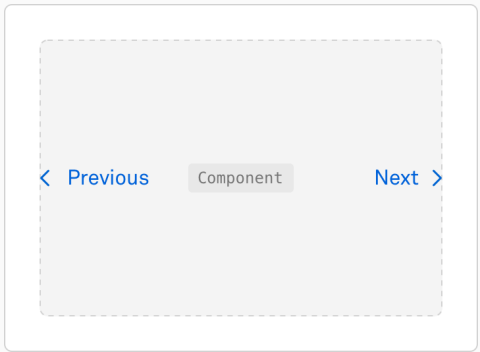


Don't.

Only place above a component



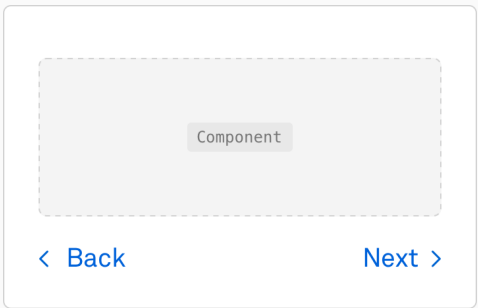
Overlap a component



Full

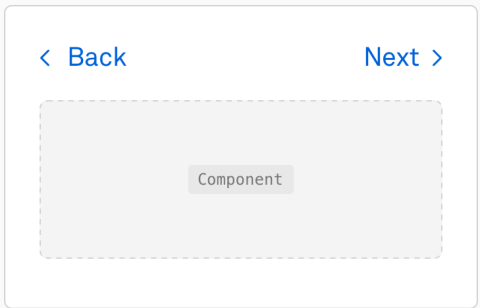
Do.

Place Big variant below the full-screen component

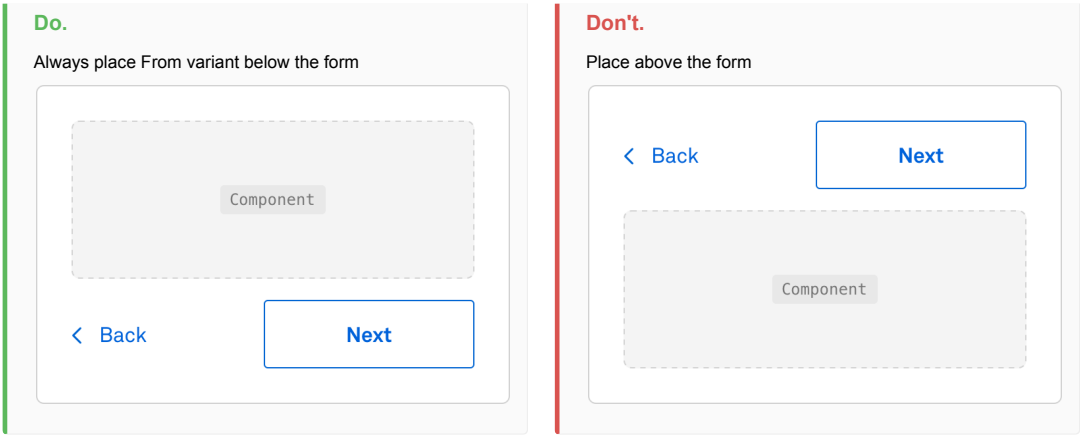


Don't.

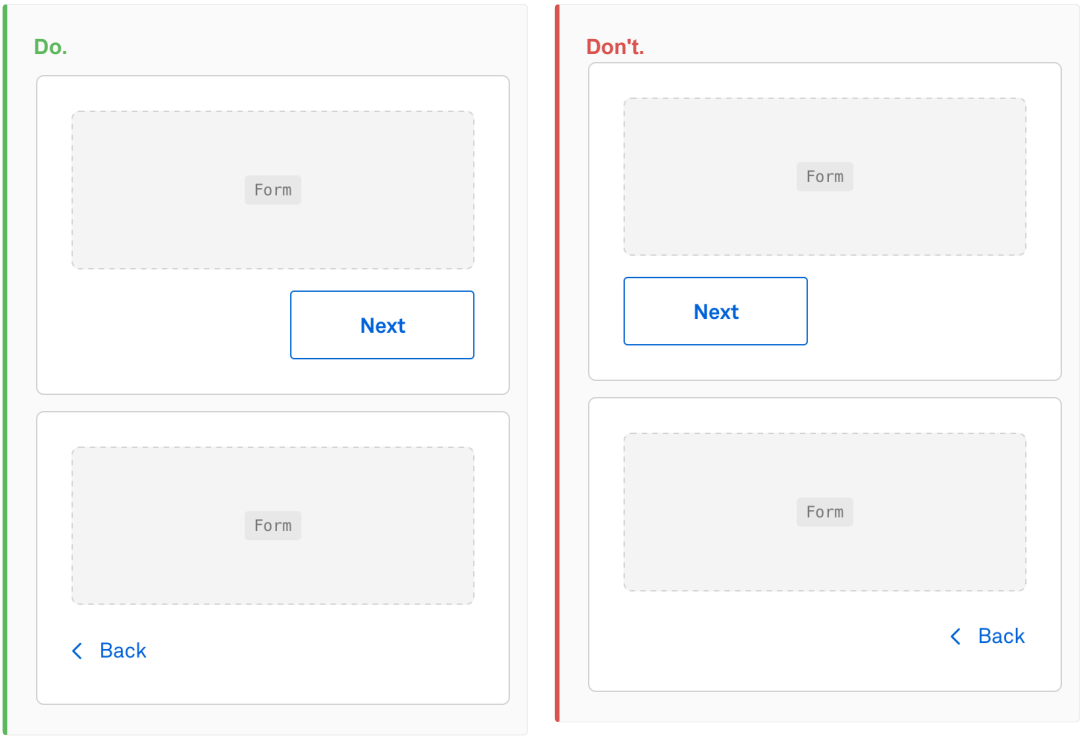
Above a full-screen component



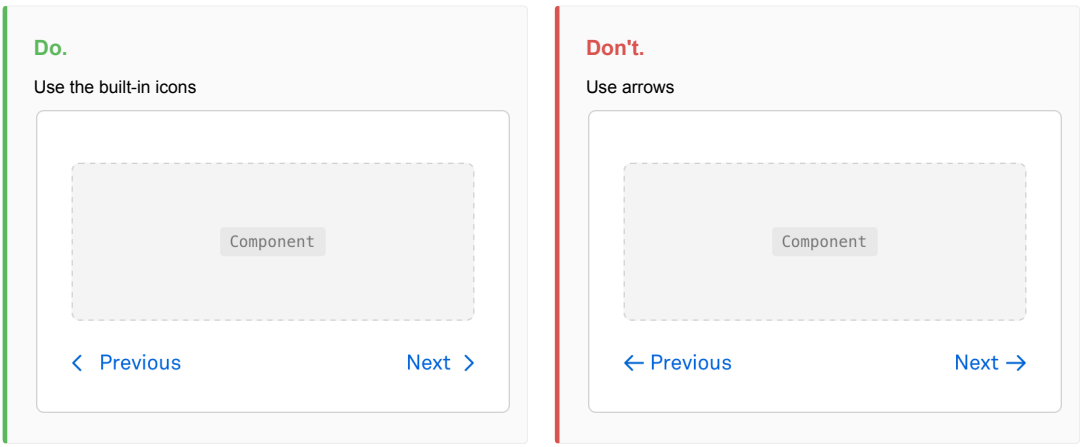
Form



- **Backward buttons should always be on the left and Forward buttons always on the right.**
  Do not switch the position of either Backward or Forward Button, even when using Start and End variants which do not have an opposing button.



- **Maintain the recommended iconography.**



Accessibility Considerations

The interactions for Backward and Forward Buttons are inherited directly from the corresponding Action Button.

Keyboard

Users must be able to navigate to and select each button using the keyboard alone. In most browsers, the TAB key allows users to navigate between buttons and the ENTER or SPACE key allows users to select a button.

In Sequence, the buttons should be navigated in order by pressing TAB.
