A divider is a thin line that groups content in lists and layouts.

Useful Docs

Specs

- Divider (Web)
- Divider (Android & iOS)
- Colour Aliases

UI Playground

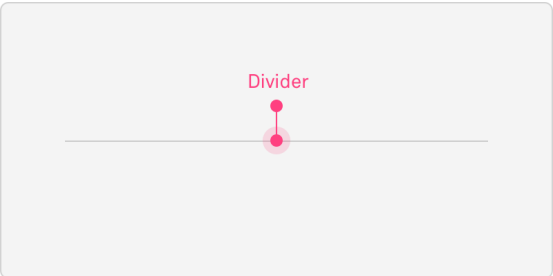
- Web Playground
- React Playground
- Android Catalogue app
- iOS Catalogue app

Usage Guidelines

Dividers can be used to:

- Divide content groups/sections or related content items.
- Create lists or layouts and separating items into clear groups.
- Support comprehension and reduce the need for white space to break up content.

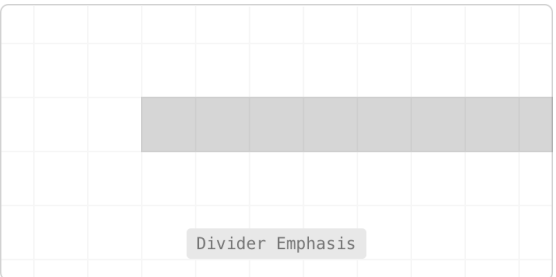
Anatomy



Variants

There are 2 colour variants of the divider to choose from — *Divider Emphasis* and *Divider Subtle*.

Emphasis



Subtle

Use this colour variant:

- For styling Edge to edge divider.
- Android and iOS only.

Use this colour variant:

- For styling Middle divider and Inset divider.
- Can be used across Android, iOS and Web.

Web Requirements

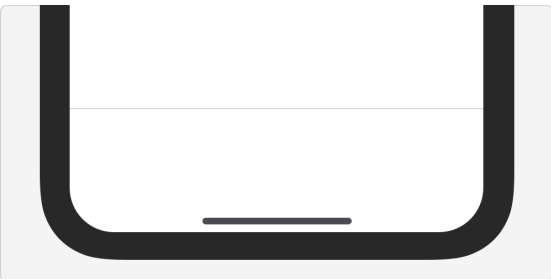
Although the Divider Emphasis colour isn't used in Web, you may still use this colour alias as a border colour.

Creating a Divider

There are 3 different approaches to constructing a divider:

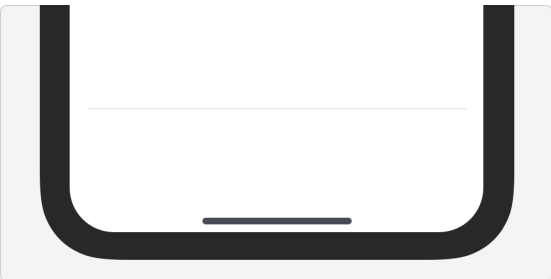
- Edge to edge — Spans the entire length of a layout.
- Middle — Centred in a layout, with a fixed padding on left and right.
- Inset — Follows where readable content begins, also guides user's eye to the content.

Edge to edge



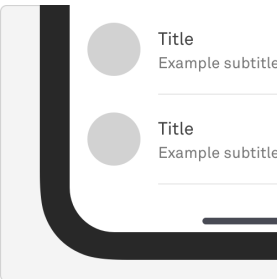
- Primarily use it for separating content into sections.
- Always paired with divider emphasis colour.

Middle



- Primarily used to separate related content.
- Always paired with divider subtle colour.

Inset



- Inset divider starts where re
- Use it between list items in
- Always paired with divider s

Best Practices

- **Dividers should be noticeable in a layout, but not jarring.**
  Avoid using custom divider colours, use our divider colour aliases.
- **Use dividers sparingly, to create groupings rather than separate items.**
- **Dividers should only be used if elements cannot be separated using white space.**

Accessibility Considerations

Dividers should be used in combination with other techniques to indicate the separation of related content. When there are other methods for determining the relationship of content, dividers are viewed as purely decorative and do not need to meet any accessibility guidelines.

Other techniques for indicating related content for assistive technology

- In Web, we can make use of heading levels, marking up the content using lists or <section> elements. Some of these approaches may be combined, and the right solution will often depend on the content and design.
- In Android and iOS apps, we must pay attention to ensuring related content is grouped together using the right accessibility attributes to avoid duplication of announcements and unnecessary swipes. We can also make use of native headings and list views.

Keyboard

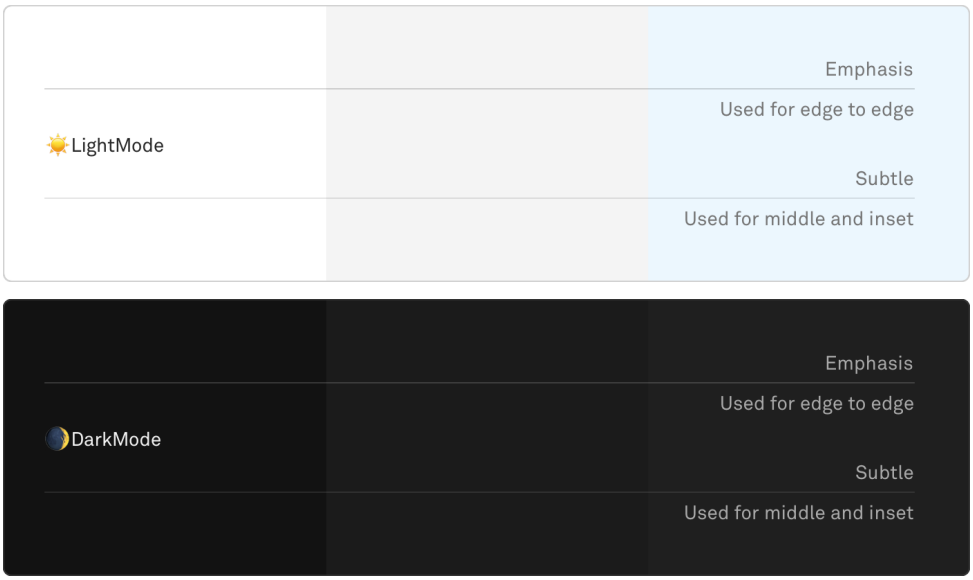
Dividers are not interactive so have no keyboard behaviour.

Screenreader

Dividers that are decorative should be ignored by screen readers.

Capabilities

Dividers are scaled automatically based on the user's text size preferences.



Dividers will automatically update its appearance based on user's light or dark appearance settings.

No labels
