Drill Down Row allows users to navigate deeper within a flow and shows more details of a particular item. It can also be used to group information in an effective way so users can find content quicker and easier when using a mobile device.

Useful Docs

- Using Chevron on Android UI
- Icons Library
- Navigation Transition on Mobile
- Accessibility on Opening In-app Browser

Specs

- Drill Down Row (Android)
- Drill Down Row (iOS)

UI Playground

- Android Catalogue app
- iOS Catalogue app

Usage Guidelines

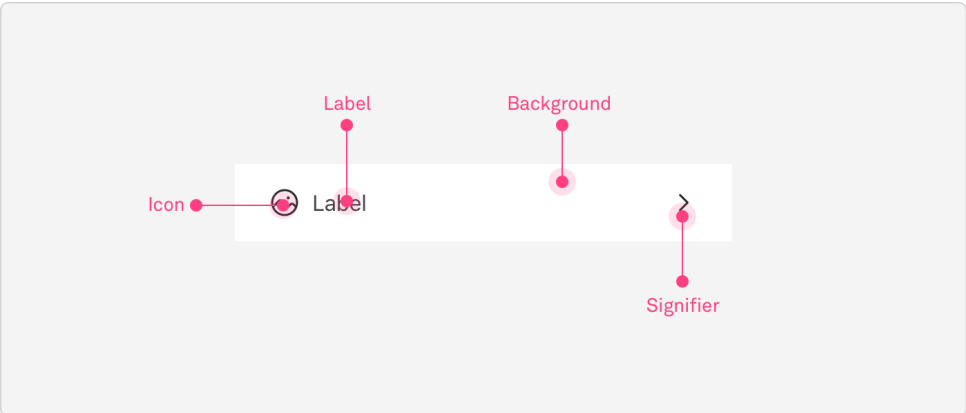
Use Drill Down Row:

- To group or organise content.
- To help breakdown complicated information structures into multiple levels for effective navigation.
- To allow users to navigate deeper within a flow.
- To display more details of a particular item/feature.
- To display an in-app browser.

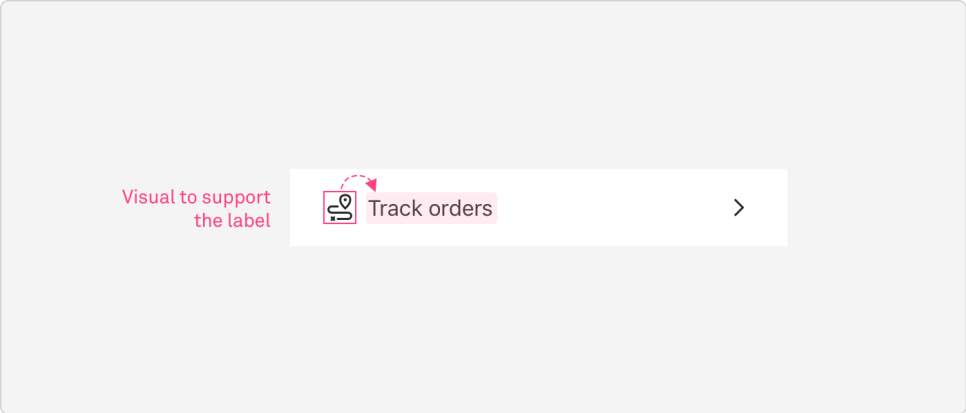
Don't use Drill Down Row:

- To open external apps, such as Settings.

Anatomy



Choosing a Supporting Icon



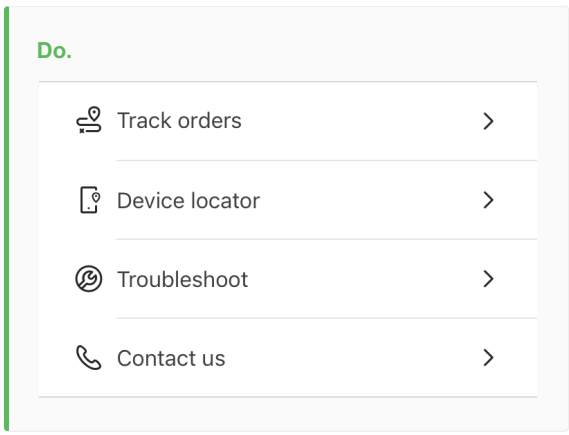
Not every Drill Down Row needs an icon.

You should only add an icon if:

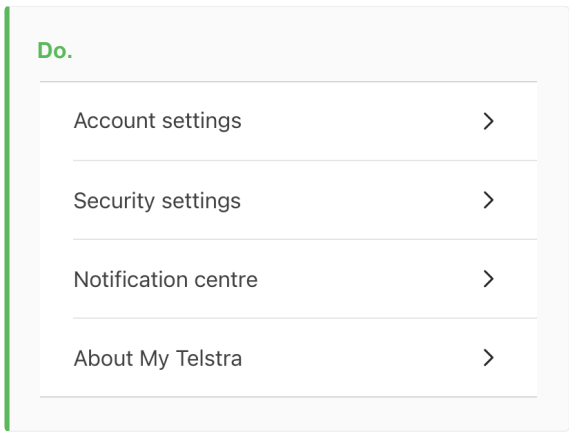
- The specific icon can convey meaning more effectively than with just the label.
- You need to differentiate the different rows within the same group.

The icon you choose should match its recommended usage in our Icon Library.

Examples

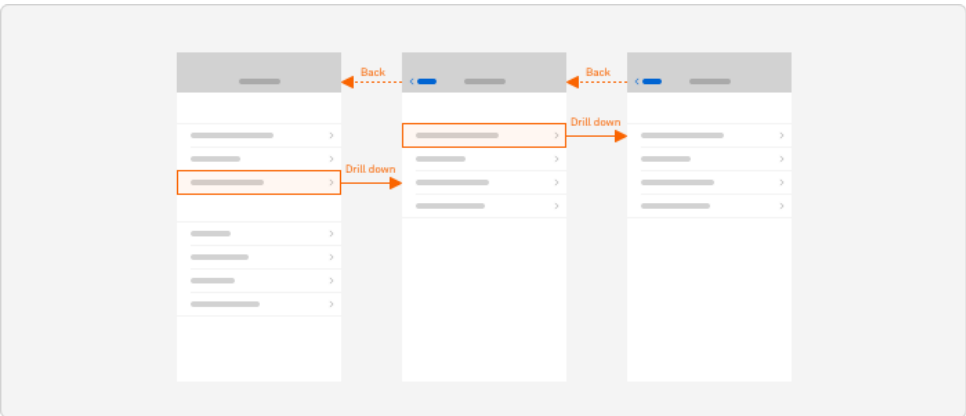


Icons match recommended usage, and have the same layout within the same group.



Not all rows require an icon to convey meaning.

Structuring Your Information Architecture

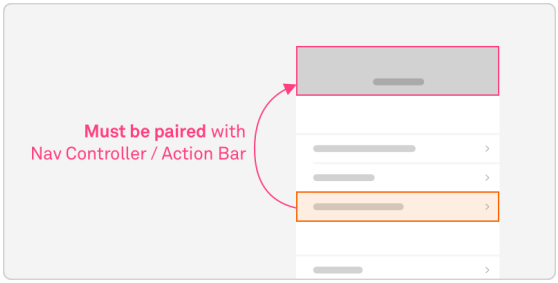


Drill Down Row allows us to:

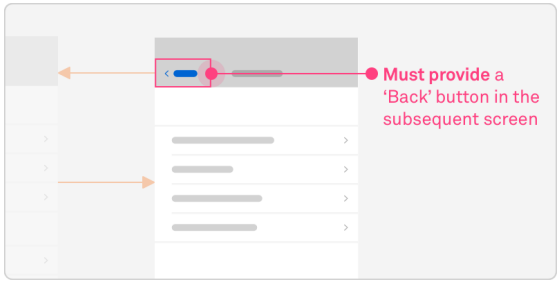
- **Breakdown complicated information structure into multiple levels**.
- Help users **get to their content quicker** and **easier** when using a mobile device.

In the mobile app architecture, this is a *Hierarchical* approach to demonstrate the organisation of our data.

Keep in Mind



Drill Down Row must be paired with a Navigation Controller on iOS or an Action Bar (aka App Bar) on Android in order to perform navigation animation to the next screen.



When using Drill Down Row, you must provide a 'Back' button in the subsequent screen to allow users to go back to where they came from.

In addition, on iOS systemwide screen-edge gestures **should not** be interfered with. Users should be able to navigate back by swiping from the side of the screen.

Navigation Transition

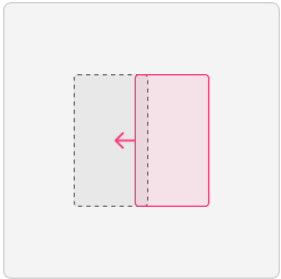
Drill Down Row is used to allow users to make 1 choice per screen until you reach a destination.

It's important for designers to ensure the **navigation feels natural** and **familiar**, but it shouldn't dominate the interface or draw focus away from content.

Hence, we strongly recommend to use system built-in navigation transition for Drill Down Row to guide users and help them understand the relationships between 2 screens.

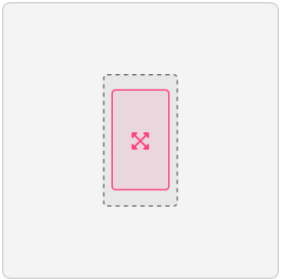
When user interacts with the Drill Down Row, we use Hierarchical Navigation Transition. The transitions may be different depending on the platform and type of device you're using:

iOS



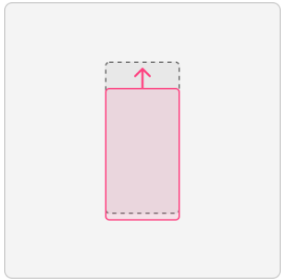
Uses *Push* animation.

Android (on Pixel)



Uses *Shared Z-axis* animation.

Android (on Samsung)

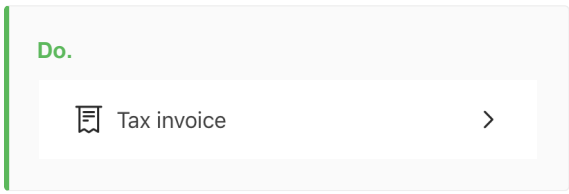


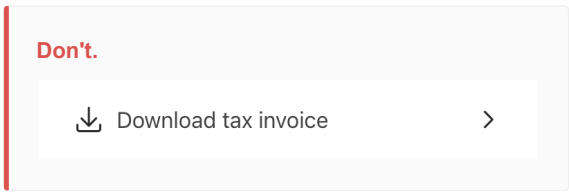
Uses *Slide Up* animation.

These specific navigation transitions are already established on Android and iOS to perform this Drill Down action. It's important keep consistent with platform transition to avoid any confusion on where we're taking user in their flow.

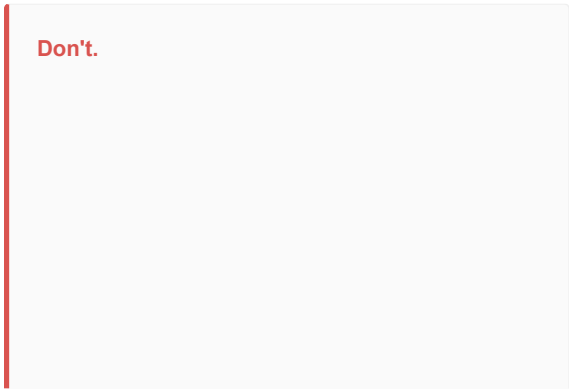
Best Practices

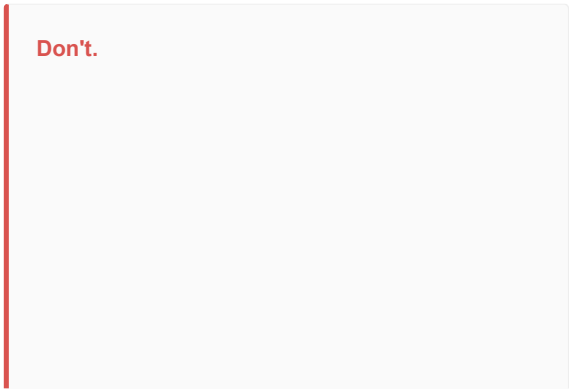
- **Drill Down Row should only bring user to the next screen, not trigger an action.**

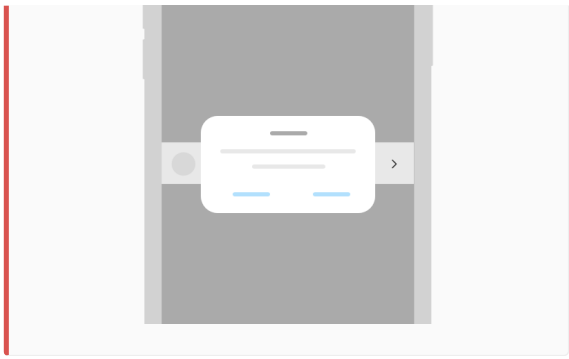




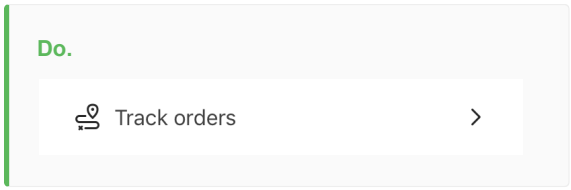
- **Don't present any sheet UI or modal dialogue UI after tapping on Drill Down Row.**

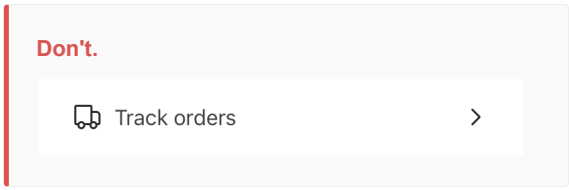




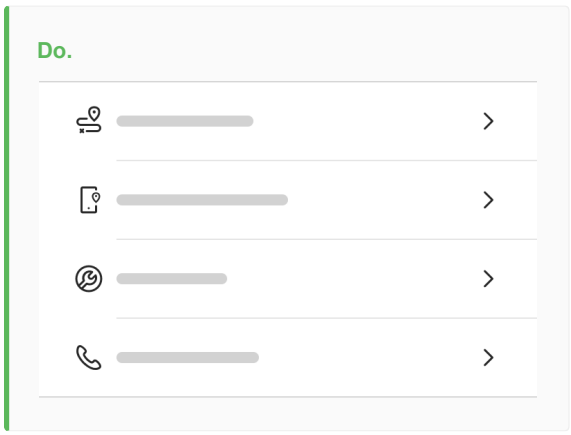


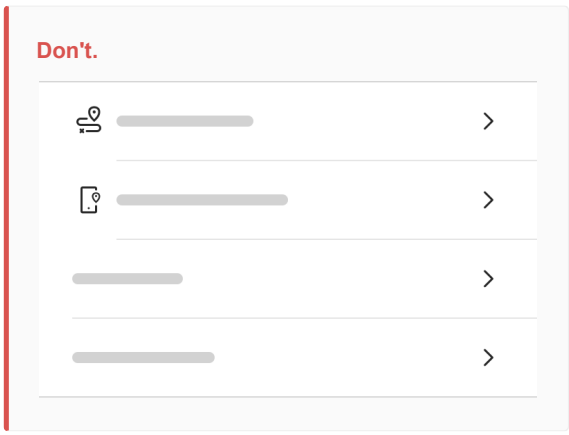
- **Don’t add an icon because it's visually pleasing.**
  Only add an icon if it can convey meaning more effectively than with just the label. Usually the text label is sufficient. When **an incorrect icon is used**, it not only increases visual clutter on the page, but it may also lead to user confusion. For more guidance, see Choosing a Supporting Icon section.
- **The icon must match its recommended usage in our icon library.**
  To ensure consistency across our products/services, always check our Icons Library for the correct usage.



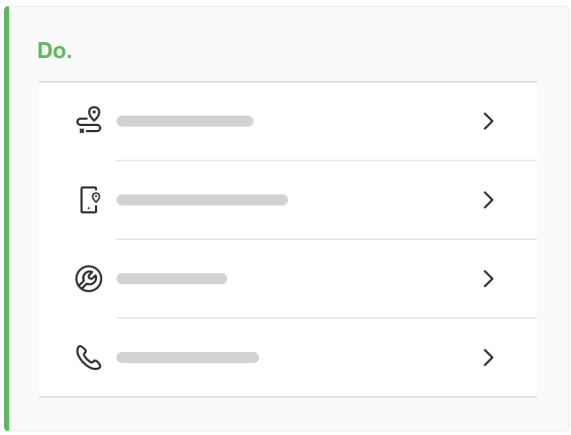


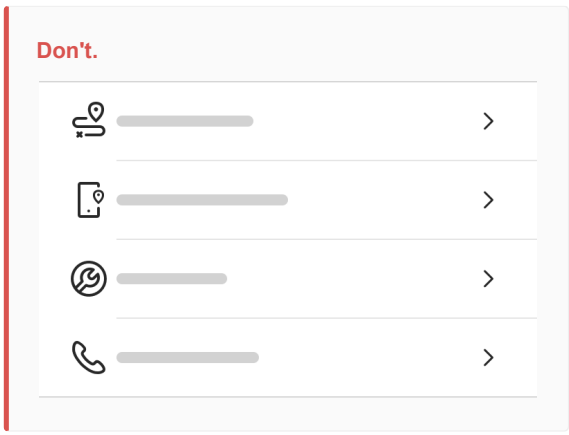
- **Always present using platform's navigation transition.**
  On iOS, always use Push animation; Android Pixel uses *Scale Big* animation, Android Samsung, uses Slide Up animation. See Navigation Transition.
- **Layout within the same group should be consistent (with or without icons).**



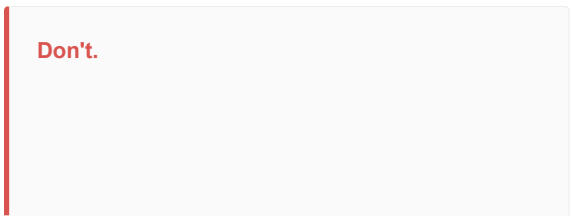


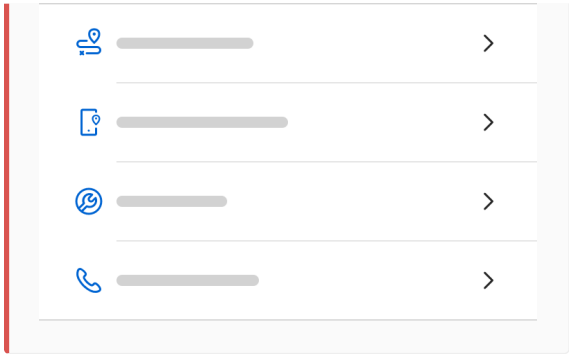
- **Only use size 24x24 icons.**



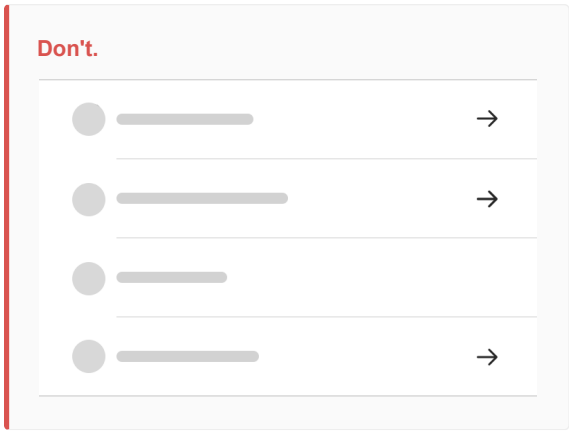


- **Don't change icon colour. It should always be the same as the text colour.**





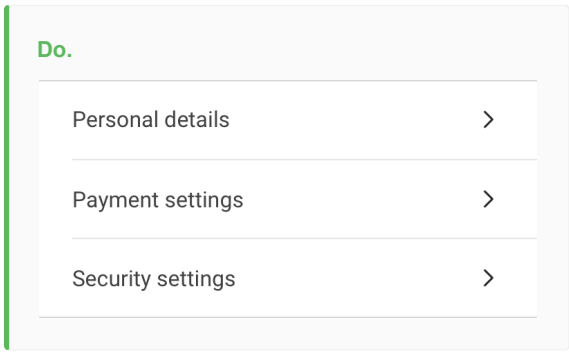
- **Never modify or remove the Indicator icon.**



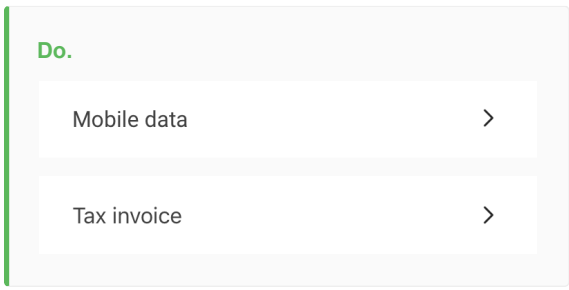
Content Guidelines

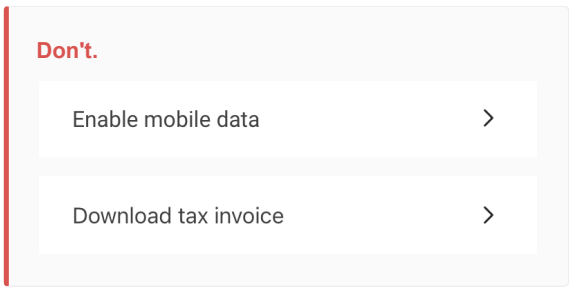
Drill Down Label

- Use a descriptive noun label that clearly describes the next level of content the user will be taken to.



- Don't use verbs that indicate a feature or action will be triggered. A Drill Down Row **only** brings users to the next screen which may contain actions for the user to take.





- Avoid redundant verbs that tell the user they will 'View' or 'Open' content

Please refer to Telstra's Content Style Guide.

Accessibility Considerations

Drill Down Row are designed to meet the WCAG 2.1 Success Criteria outlined below. All requirements should be considered and understood when using the pattern.

> ⚠️ indicates accessibility requirements will need to be met at time of usage, such as when authoring.

- ⚠️ 1.1.1 Non-text Content (A) - Drill Down Row icons are decorative and will be ignored by assistive technology
- 1.3.1 Info and Relationships (A) - Each Drill Down Row must contain a label
- 1.4.3 Contrast Minimum (AA) - All text meets the 4.5:1 contrast ratio
- 1.4.4 Resize Text (AA) - When resized to largest settings on the device, text is not truncated
- 1.4.11 Non Text Contrast (AA) - Aspects of the Drill Down Row required for identification meet the contrast ratio of 3:1
- 2.1.1 Keyboard (A) - Drill Down Row are keyboard accessible
- 2.4.3 Focus Order (A) - Drill Down Row follow a sequential focus order
- ⚠️ 2.4.6 Headings and Labels (AA) Labels are descriptive
- 2.4.7 Focus Visible (AA) - Drill Down Row has a clear visible focus state
- 2.5.3 Label in Name (A) - The accessible name of the Drill Down Row matches the visible label
- 2.5.5 Target Size (AAA) - The touch target size is at least 48 x 48 (dp/pt/px)
- ⚠️ 3.3.2 Labels or Instructions (A) - Labels and instructional text are clear and unambiguous
- ⚠️ 3.4.2 Consistent Identification (AA) - Drill Down Rows that perform the same function are consistently identified by the label
- 4.1.1 Parsing (A) - Drill Down Row uses valid code
- 4.1.2 Name, Role, Value (A) - Drill Down Row is coded to expose the correct name, role and status to assistive technology

Keyboard

- Users must be able to navigate to and interact with a Drill Down Row using keyboard alone.
- A clear visible indicator should also be present when Drill Down Row has keyboard focus.

Screen reader

On screen reader focus, announcements must include:

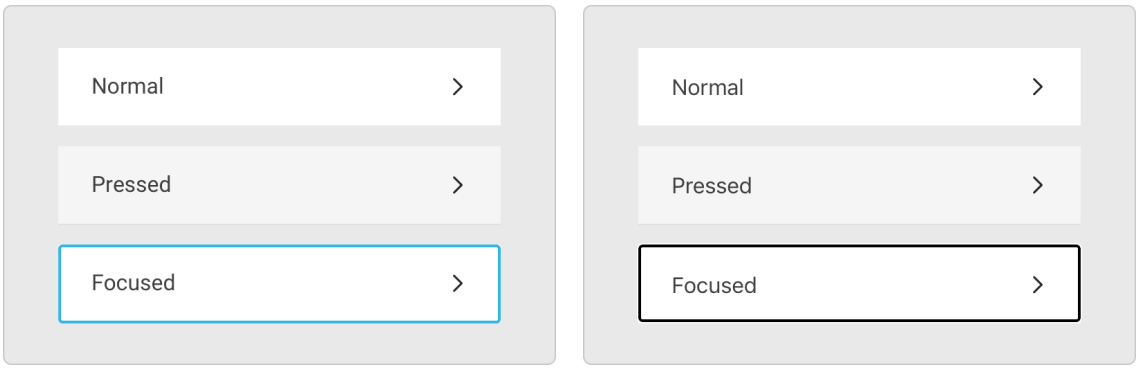
- The **label**
- The **role** ie "button"

Interaction States

There are 3 interaction states in each row as a user interacts with it:

1. Normal
2. Pressed
3. Focused

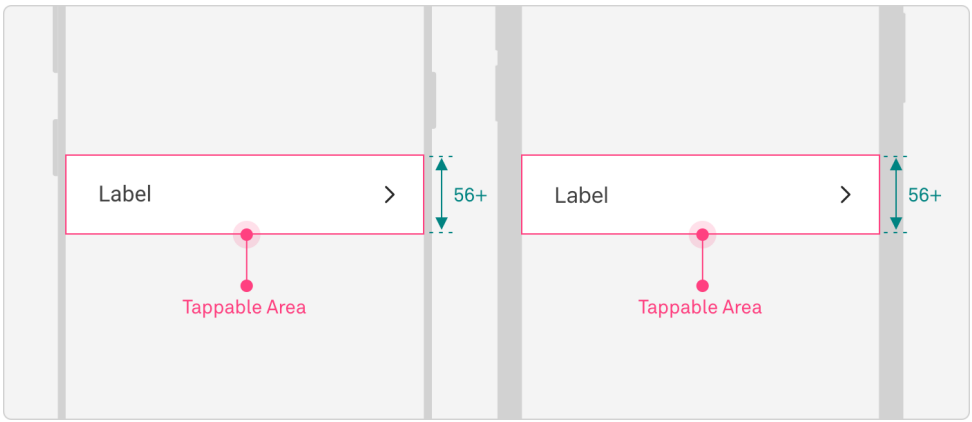
Android **iOS**



Android Pressed state is displayed using Ripples animation.

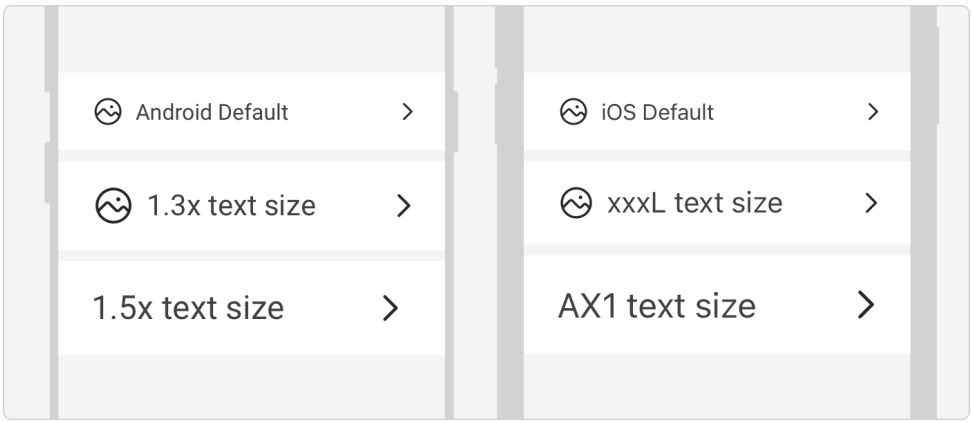
Find out more details on the different states, see Interaction States.

Tappable Area



Drill Down Row has a minimum height of 56 (sp, pt) that allows users to easily tap on a row on a mobile device.

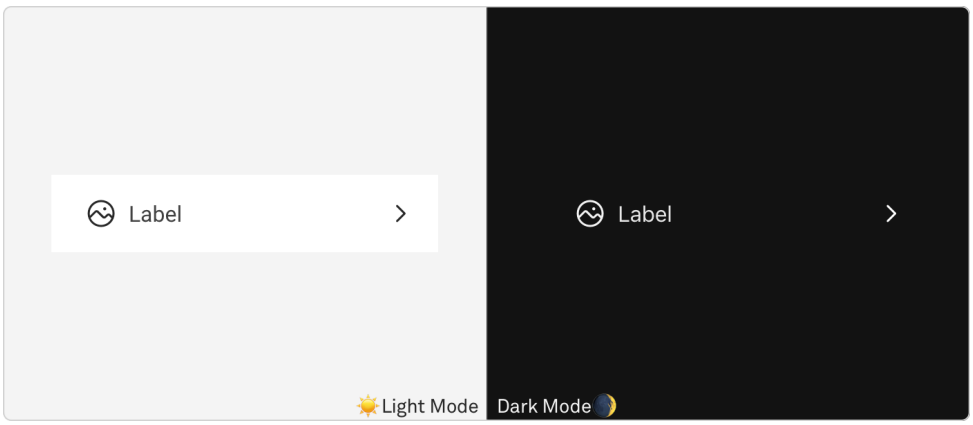
Capabilities



Robust Layout.

Components are scaled automatically based on the user's text size preferences.

The supporting icon is hidden in larger text sizes (1.5x on Android & AX1 on iOS) to allow more space to display more critical content.



Dark Appearances.

Automatically update its appearance based on user's light or dark appearance settings.
