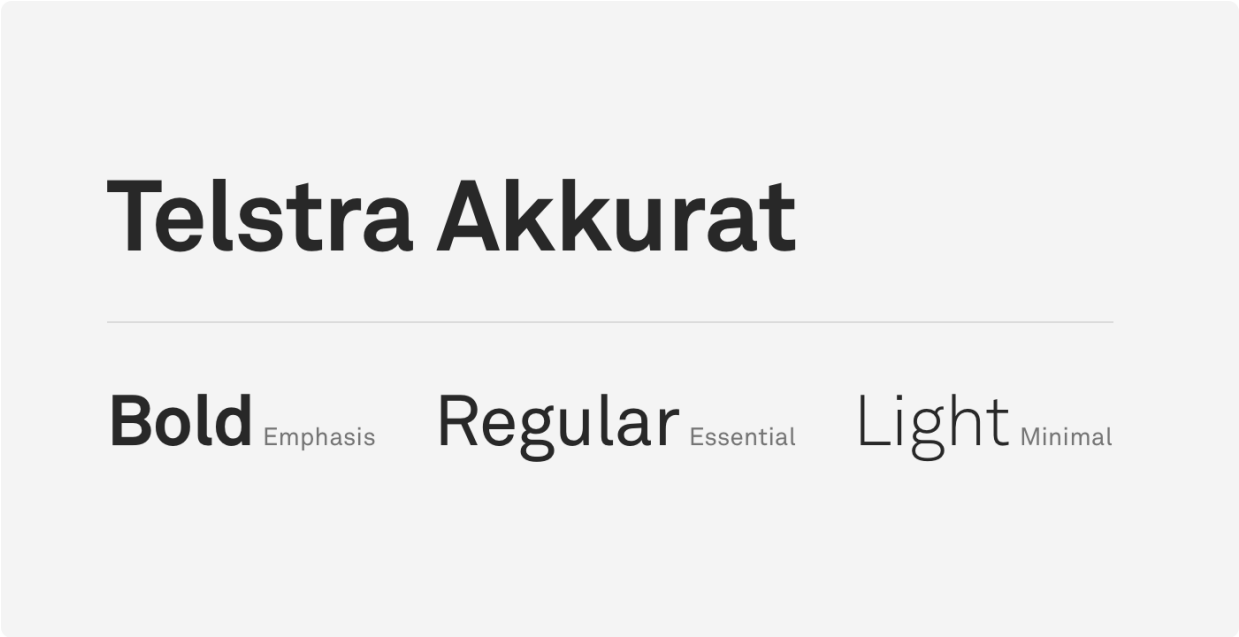
Font

Created by Davyd Geyl, last modified by Hillary Purssey on 10 Nov 2020



Font refers to the size, weight and style of a typeface. Fonts are a foundational pattern in the design system and are not intended to be used directly. Instead refer to Text Styles to understand how to use within your design and development.

Rationale

The Telstra Akkurat custom typeface is used for web, while mobile platforms use native fonts; Roboto for Android and San Francisco for iOS. By relying on native fonts instead of custom we inherit benefits such as improved legibility and accessibility support.

Font Sizes

The table below shows the available font sizes we support in each of the platforms.

Root scale is 1 rem = 16px

Platform	Android	iOS	Web	
Font size unit	**sp**	**pt**	**px**	**rem**
Available Sizes	-	-	56	3.5
	40	40	40	2.5
	32	32	32	2.0
	24	24	24	1.5
	20	20	20	1.25

	16	16	16	1.0
	14	14	14	0.875

Typefaces

Custom typeface is used in Web, while mobile platforms use native fonts.

Aa Telstra Akkurat

Aa Roboto

Aa San Francisco

Platform	Typeface Name	Type	About
Web	Telstra Akkurat	Custom	Telstra Akkurat is the Telstra brand font used across all collateral including print and digital. The typeface comes from Akkurat with minor adjustments to suit the brand.
	Arial	Browser fallback font	Arial is a simple web safe font defined as the Telstra fall back font for web. This font will appear for any native elements (e.g. dropdown) or as a brief flash on slower loading systems. Arial does not have a Light weight.
Android	Roboto	Android default	Roboto and Noto are the standard typefaces on Android and Chrome. Roboto is a sans-serif typeface family developed by Google as the system font for its mobile operating system Android.
iOS	San Francisco (SF)	iOS default	San Francisco (SF) is the system typeface introduced from iOS 9. The fonts of this typeface are optimized to give your text unmatched legibility, clarity, and consistency. The San Francisco typeface was designed to be highly legible at both small and large sizes. Dynamic Type provides additional flexibility by letting readers choose their preferred text size. SF UI was first introduced in iOS 9, Apple later on updated the typeface to SF Pro from iOS 11. SF Pro Display is for 20pt or Larger SF Pro Text is for 19pt or smaller

Letter Spacing

Letter spacing (also known as tracking)
The relationship between font size and letter-spacing is pretty straightforward: as size increases, letter-spacing decreases, and as size decreases, letter-spacing increases.

- Large text (e.g. titles and headings) should have decreased letter-spacing
- Very small text should have increased letter-spacing
- Increase letter-spacing with uppercase type
- Light type set on a dark background requires a small increase in letter-spacing

Parameter	Rule
Letter Spacing	Native fonts use primarily auto setting Custom fonts letter spacing has been handpicked

Line Height and Density

Line height (also known as leading) is the space between lines of text.

Parameter	Rule	Role
Headings	Font size x 1.3 (or 1.4 depending on size)	Use heading styles or font sizes larger than 32px / 2 rem
Body	Font size x 1.5 (e.g. Body 16 x 1.5 = 24px / 1.5rem)	Recommended for longer content e.g. articles
