A grid is a framework of columns and rows. It helps to lead the eye and comprehend content. It is responsive and scrolls vertically.

Usage Guidelines (for Designers)

A responsive layout grid is the foundation that anchors all content in Web.
It is essential to ensure balance, order, and visual harmony in layouts.
The Able Grid is a fluid implementation meaning a design will be full responsive across all viewports.

When designing for web:

- Design from the smallest Viewport first (i.e. Mobile first)
- Always align content to the 12 column grid provided - DO NOT place content outside of the container or misalign with columns
- Sense check your layout in production prior to release to avoid any unexpected breakages
- Use Spacing between content for horizontal spacing
- Refer to the Device Optimised Layout recommendations provided to ensure consistency across digital assets
- Use the appropriate Viewport canvas provided in sketch as a base (see below)

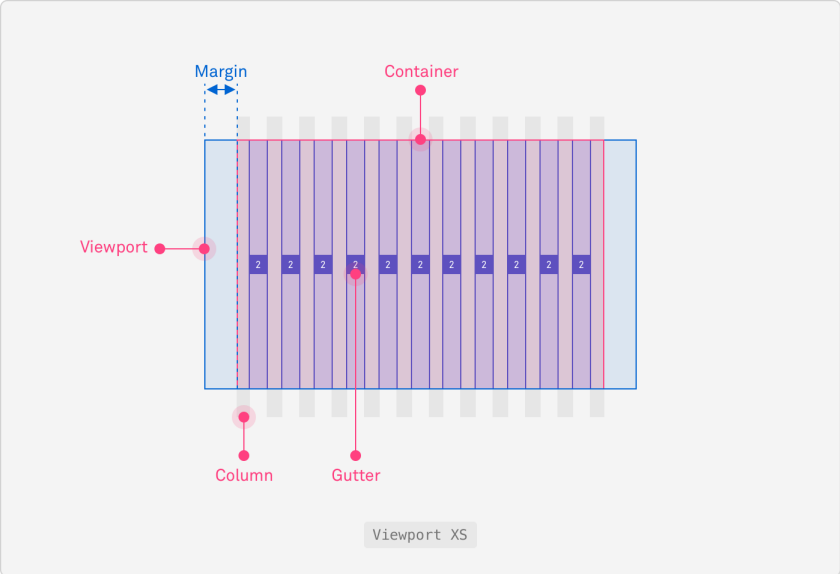
Design applications don't adapt to the screen size in a fluid manner. To circumvent this constraint, we design using specific screen sizes. We call these "viewports".

Viewport	Value (pixels)	Canvas size	Container size
viewportXS	320 to 767	360px	306px
viewportSM	768 to 1023	768px	652px
viewportMD	1024 to 1599	1360px	1156px
viewportLG	1680+	1680px	1428px

Usage Guidelines (for Developers)

Use the provided SCSS or CSS to build your layouts. Check the usage examples and documentation on the web playground.

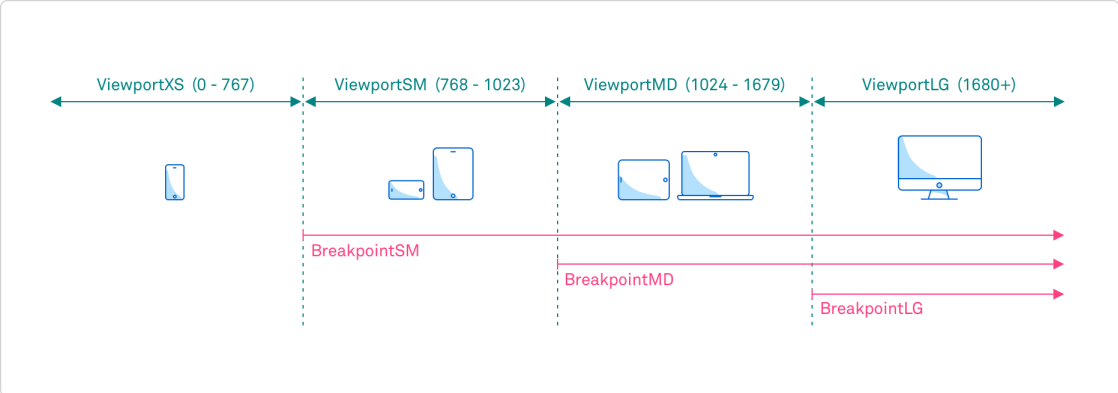
Anatomy



Grid Properties

Viewport Name (px)		Gutter (px)	Container	Max-width	Columns	Margin
viewportXS	0px - 767	16	85% of viewport	1428px	12	7.5% of viewport on each side of container
viewportSM	768 - 1023	32				
viewportMD	1024 - 1679	40				
viewportLG	1680+	56				

Breakpoints and Viewports



The Grid scales across devices. To understand how this works, we must look at 'breakpoints' and 'viewports'.

Able web takes a Mobile First approach to development; the simplest layouts are on mobile, they become more complex as the screen size increases.

We have prescribed values where the layout changes as the screen size increases. We call them 'breakpoints'.

Breakpoint	Value (pixels)
default	0+
breakpointSM	768+
breakpointMD	1024+
breakpointLG	1680+
