A multi select row represents one of the selection options in a multi selection list. Users can interact with the row to toggle between selected or unselected states individually.

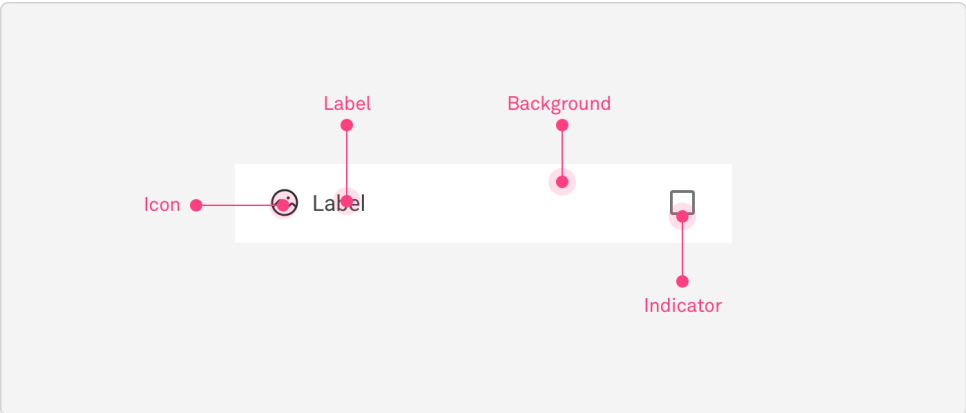
Usage Guidelines

A multi select row is used to:

- Toggle an option between Selected or Unselected states.
- Construct a multi selection list, as long as it contains at least 2 options.

> **Keep in mind: Never use 'Multi Select Row' by itself**
>
> Multi select row is designed to be used with at least one other multi select row to provide multi selection functionality.

Anatomy

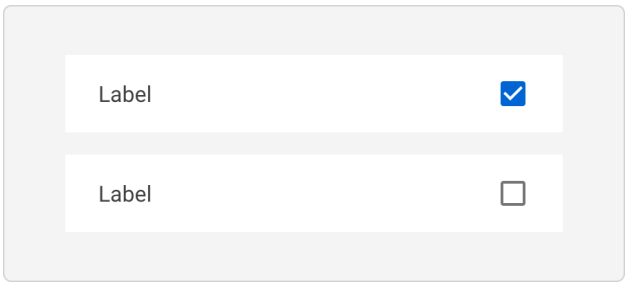


Design of Multi Select Controls

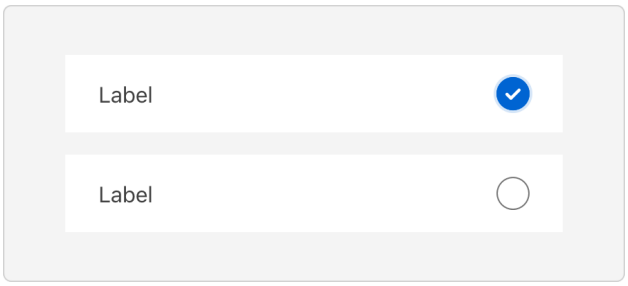
Android and iOS use different UI controls to provide multi selections in their respective platforms.

In order to provide intuitive UI (familiarity and consistency) to the user in their platform, we have designed the indicators to follow the platform design guidelines in Android and iOS.

Android UI



iOS UI



Supporting Icons

An additional icon can be added to a multi select row to:

- Convey the information more quickly than just the label itself.
- Help to differentiate between the different options within a list.

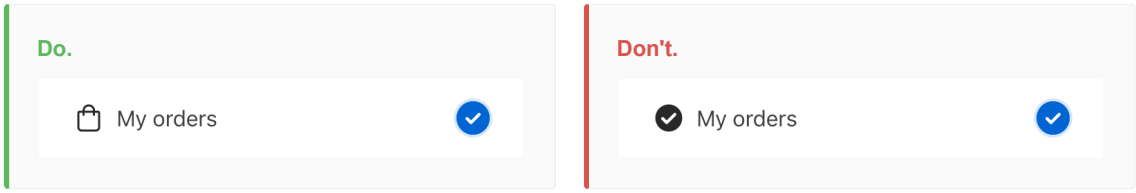
For guidance on picking the appropriate icon, see Icons.

Label Only

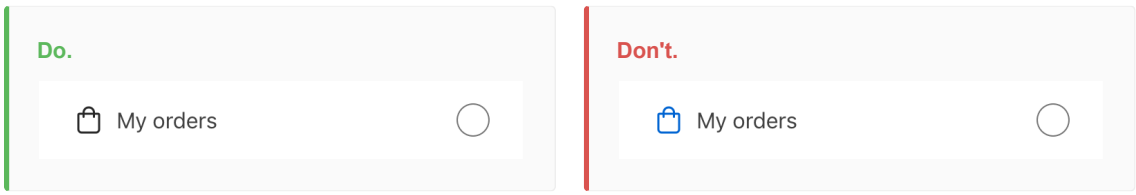
Label with Icon

When adding a supporting icon, you must:

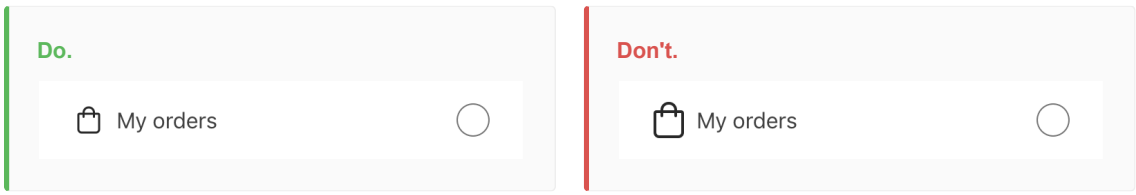
- Avoid adding icons that are similar to a selection indicator, such as the Success icon.



- Ensure icon colour is the same as the text colour.



- Only use icon in 24x24 size.



Interaction States

There are 6 unique states in Single Select Row.

Each row can be *Selected* or *Unselected*, and there are 3 interaction states in each row as a user interacts with it:

1. Normal
2. Pressed
3. Focused

Keep in mind: *Disabled state* is not supported this control. See why we don't support disabled state.

Android

With Indicator Selected

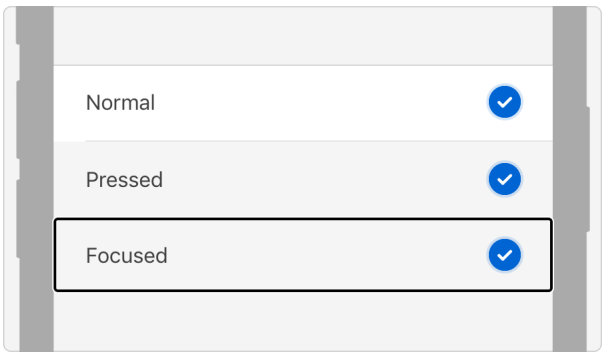
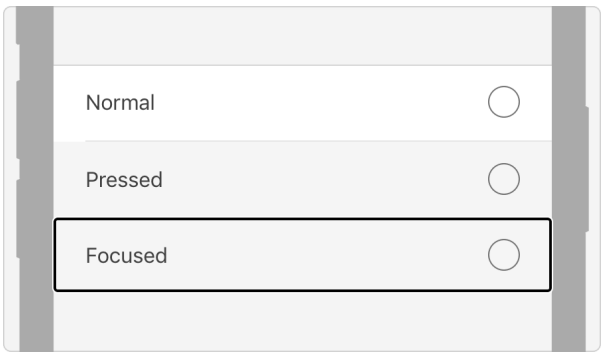
iOS

With Indicator Selected

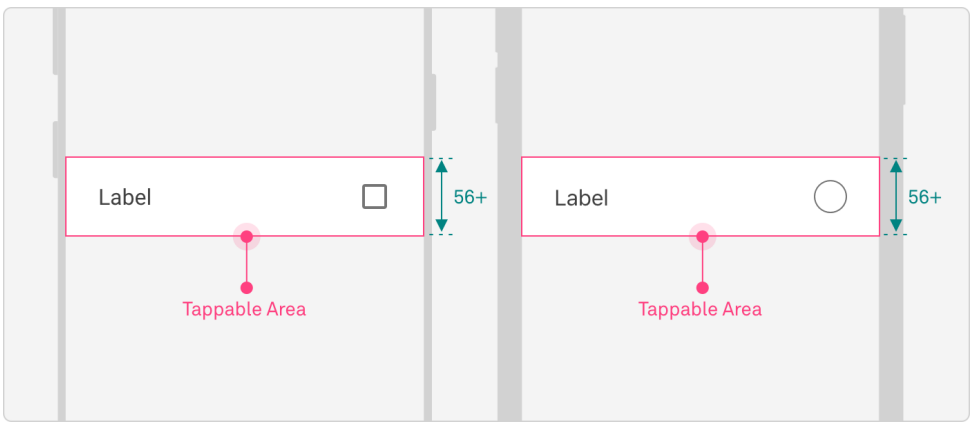


With Indicator Unselected



Find out more details on the different states, see Interaction States.

Tappable Area



Eventhough the indicator is located on the right, the whole row is designed to be tappable to allows user easily select an option on a mobile device.

It also has a minimum height of 56 that allows sufficient spacing between each row.

Best Practices

For each row:

- **Label options clearly based on what the option will do.**
  Have a distinct label that clearly describes what the row option represents. Don't use negative language.
- **Only add supporting icons if absolutely necessary.**
  Don't add icons to the row because it looks pretty with text. It may have an impact on user's cognitive load if an inappropriate icon is used. Only add an icon if it aids

comprehension of the options.

- **Each row should be independent. Selecting a row should not select or deselect other rows.**
  Users should be able to select or deselect any row in multi selection and each row should be independent. When a user makes a selection on a row, do not select or deselect other rows.
- **In general, selecting a row does not apply the action immediately.**
  When user selects or deselects an option, it typically shouldn't take effect immediately because users may still be in the progress of making other selections. If this is the case, it's more ideal to submit user's selection when user taps on a save/done button.

For multi selection list:

- **Don't use Multi Select Row to when asking user to make exactly 1 selection.**
  If a user is required to select only 1 option, use Single Select Row instead.
- **Multi select row should never be used alone, or be the only option in a list.**
  Nature of multi selection is to always provide a user with 2+ options to select from.
- **Don't use Multi Select Row for options that are mutually exclusive.**
  All options in multi select list should be selectable. If only be one of option can be selected, such as Yes / No, then use Single Select Row instead.

Content Guidelines

To write an effective label for a Multi Select Row, you should:

- Have a distinct label that clearly describes what the row option represents.
- Keep label short, avoid phrasing as sentences.
- Use sentence case.
- Not include any punctuation.

Multi select rows must be considered in the context of a multi select list and should:

- Describe all items in the same format for consistency (single word, phrase or sentence).
- Be ordered logically, which can be alphabetical, numerical, popularity-based, or any other clear system.

Please refer to additional content guidelines listed in Telstra's Content Style Guide.

Accessibility Considerations

Multi select rows are designed to meet the WCAG 2.1 Success Criteria outlined below. All requirements should be considered and understood when using the pattern. Requirements marked with ⚠️ indicate partial compliance which must be met in build or authoring.

- 1.1.1 Non-text Content (A) - Multi select row icons are decorative and will be ignored by assistive technology
- 1.3.1 Info and Relationships (A) - Each multi select row must contain a label
- 1.4.3 Contrast Minimum (AA) - All text meets the 4.5:1 contrast ratio
- 1.4.4 Resize Text (AA) - When resized to largest settings on the device, text is not truncated
- 1.4.11 Non Text Contrast (AA) - Aspects of the multi select row required for identification meet the contrast ratio of 3:1
- 2.1.1 Keyboard (A) - Multi select rows are keyboard accessible
- 2.4.3 Focus Order (A) - Multi select rows follow a sequential focus order
- 2.4.6 Headings and Labels (AA) Labels are descriptive ⚠️
- 2.4.7 Focus Visible (AA) - Multi select row has a clear visible focus state
- 2.5.3 Label in Name (A) - The accessible name of the multi select row matches the visible label
- 2.5.5 Target Size (AAA) - The touch target size is at least 48 x 48 (dp/pt/px)
- 3.3.2 Labels or Instructions (A) - Labels and instructional text are clear and unambiguous ⚠️
- 3.4.2 Consistent Identification (AA) - Multi select rows that capture the same data also contain the same label ⚠️
- 4.1.1 Parsing (A) - Multi select row uses valid code
- 4.1.2 Name, Role, Value (A) - Multi select control is coded to expose the correct name, role and status to assistive technology

Keyboard

- Users must be able to navigate to and interact with a multi select row using keyboard alone.
- A clear visible indicator should also be present when the multi select row has focus.

Screen reader

Screen reader behaviour and the ordering of announcements will vary depending on the platform/screen reader combination being used.

On screen reader focus, announcements include:

- The **label**
- The **state** of the multi select row if selected, ie "Selected" or "Checked" and the **state** of the multi select row if unselected ie. "Not Checked" (Android only)
- The **role** ie "checkbox" or "button"

On toggling the state, announcements include:

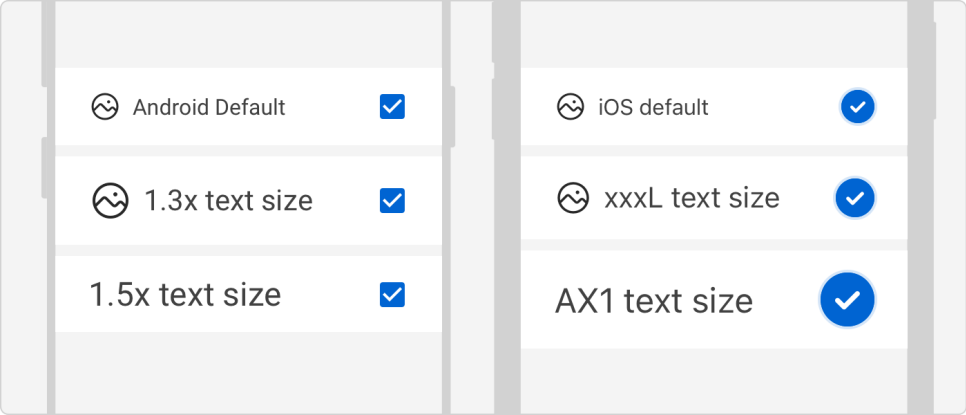
- The **state** of the multi select row if selected ie "Selected" or "Checked" and the **state** of the multi select row if unselected ie. "Not Checked" (Android only)
- The **label** (iOS only)

Capabilities

Robust Layout.

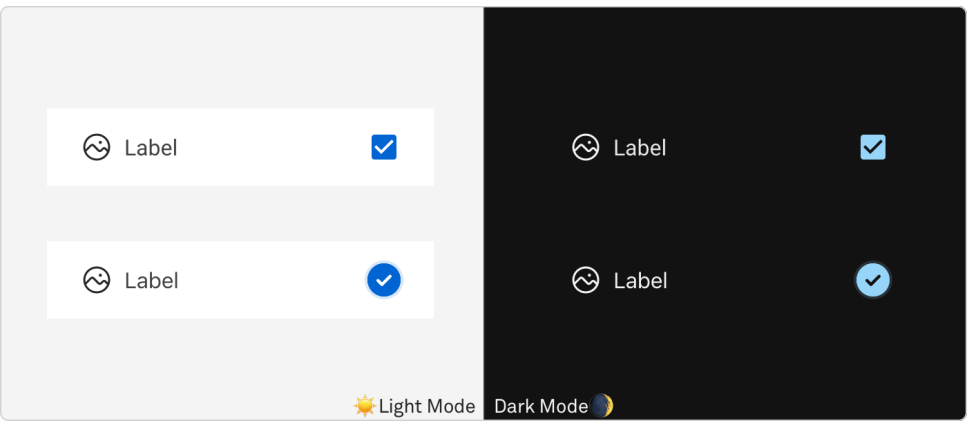
Components are scaled automatically based on the user's text size preferences.

The supporting icon is hidden in larger text sizes (1.5x on Android & AX1 on iOS) to allow



more space to display more critical content.

(Note: The indicator on Android doesn't scale due to native control limitation.)



Dark Appearances.

Automatically update its appearance based on user's light or dark appearance settings.
