Patterns

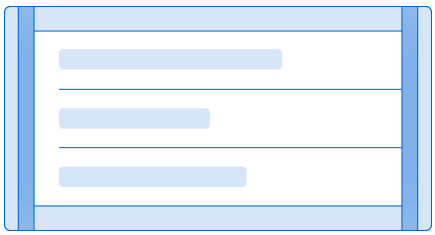
Created by Genevieve Lake, last modified by Tony Wang yesterday at 12:04 PM

Patterns are reusable combinations of components that solve common user problems.

These best practice solutions help users achieve their goals and help ensure consistency across experiences.

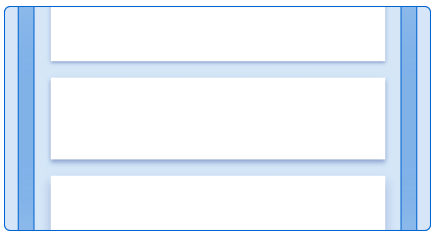
Text Styles

Text styles refer to a set of typographical styles which contain a base font as well as additional attributes such as colour, alignment and responsive sizing. Text styles are used to build hierarchy on a screen.



Divider

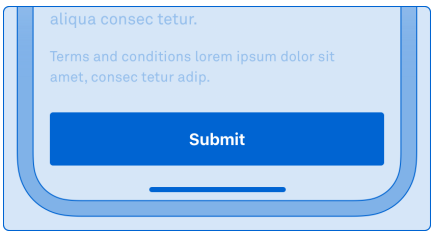
A divider is a thin line that groups content in lists and layouts.



Surface

To provide depth and mimic real world environments to increase comprehension. Measured from the front of one material to the front of another, an element's surface indicates the distance between materials and the depth of its shadow.

Buttons



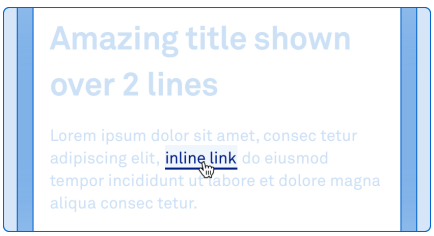
Action Button

Action buttons are used as a cue to perform actions or navigate within a flow, user can interact by clicking or single-tapping on the button.

Icon Button

Icon Button is a button UI element that utilises a single icon visual representation as the cue to perform the action. Icon Buttons can be used to perform inline actions within its context or perform screen navigation actions.

Navigation Controls



Inline Link Web Only

Inline Links allow the user to navigate between web pages. They are intended to be used "inline" meaning they sit within the flow of a paragraph or sentence.

Breadcrumb Web only

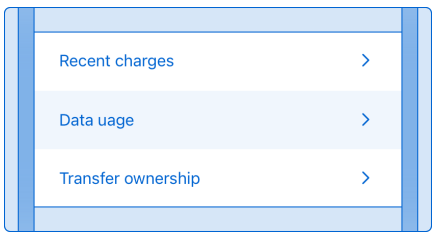
Breadcrumbs are a secondary form of navigation in the web that allow users to keep track and maintain awareness of their location as they move through different pages, folders, or files.

Skip Link Web only

A Skip Link allows keyboard users to bypass repetitive blocks of content and skip to the main content on a web page.

Button Group Sequence Web Only

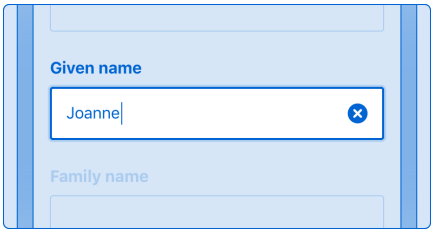
Button Group Sequence is used to provide sequential access so users can traverse forward or backward in components or flows.



Drill Down Row Android & iOS Only

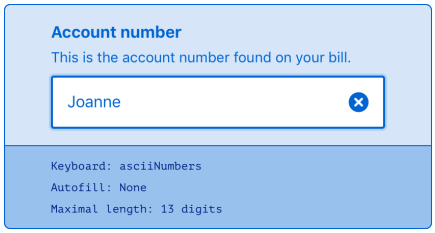
Drill Down Row allows users to navigate deeper within a flow and shows more details of a particular item.

Input Fields



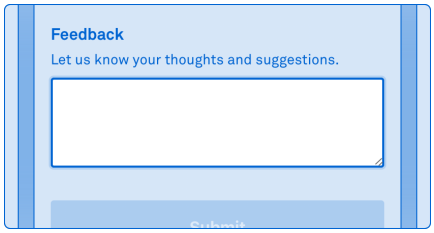
Text Field

Text fields are single-line entry fields that allow the user to input and edit small amount of text, such as name or email address.



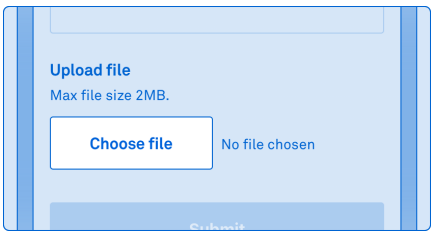
Text Input Helper

A Text Input Helper contains data and logic to streamline entry of a particular text input type in a Text Field.



Text Area

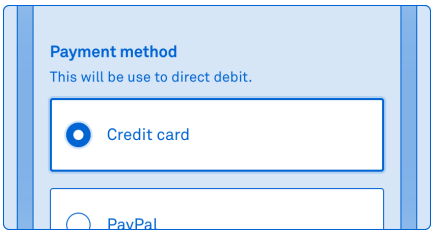
Text area allows a user to input text that's longer than a single line.



File Picker Web only

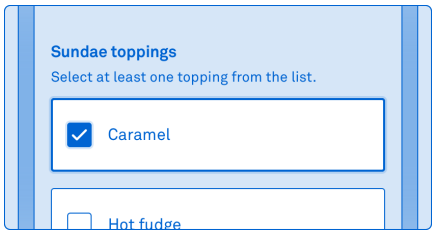
File Picker lets users choose one or more files from their device to upload within a form.

Selection Controls



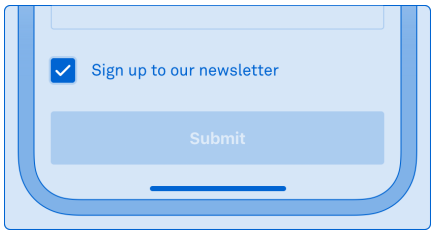
Radio Group Web only

A radio group includes a set of radio buttons that allow users to select exactly one option from the set.



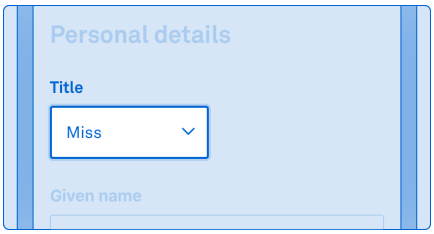
Checkbox Group Web only

A checkbox group allows users to select zero or more options from a set.



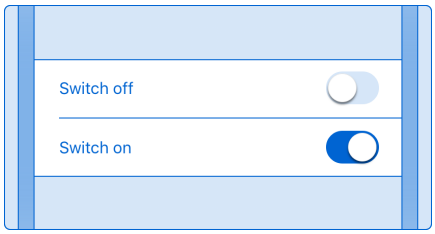
Checkbox Web only

A standalone checkbox is a single selection control that allows a user to change a setting between selected or unselected state.



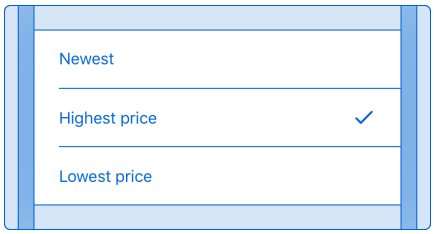
Select Web only

Select allows users to select a single option from a list that contains multiple options. It's designed to be used within a form only, and the selected value is submitted on form submission.



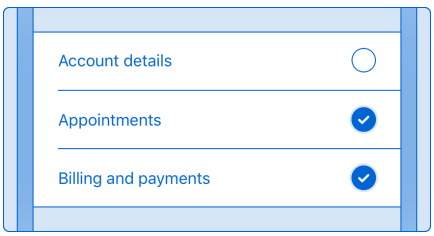
Switch Row Android & iOS Only

Switch Row represents a status of a particular setting, and it also allows users to toggle between On and Off states.



Single Select Row Android & iOS Only

A single select row represents one option in a single selection list. Users can tap on a row to mark the option as selected.



Multi Select Row Android & iOS Only

A multi select row represents one of the selection options in a multi selection list.
