A single select row represents one option in a single selection list. Users can tap on a row to mark the option as selected.

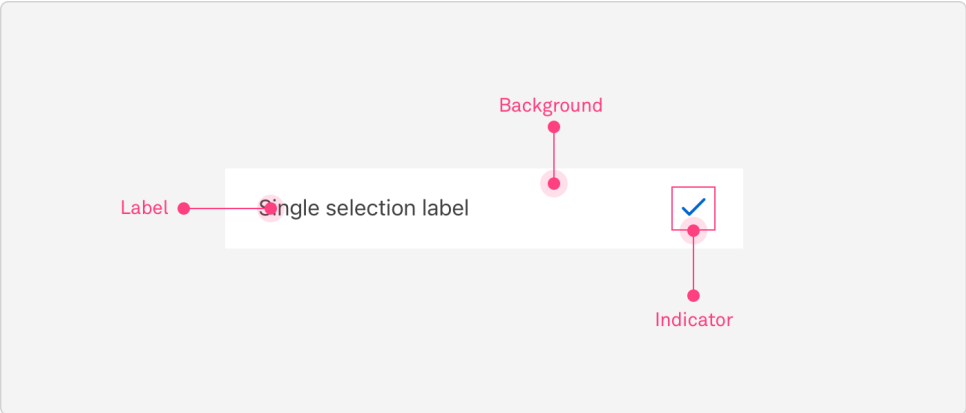
Usage Guidelines

A single select row is used to:

- Allow user to change **one selection** from a list of options.
- Construct a single selection list, as long as there are at least 2 options for users to choose from.

> **Keep in mind: Never use 'Single Select Row' by itself**
>
> Single select row is designed to be used with at least one other single select row to provide single selection functionality.

Anatomy



Design of Single Select Controls

Android and iOS use different UI controls to provide multi selections in their respective platforms.

In order to provide intuitive UI (familiarity and consistency) to the user in their platform, we have designed the indicators to follow the platform design guidelines in Android and iOS.

Android UI

iOS UI

Interaction States

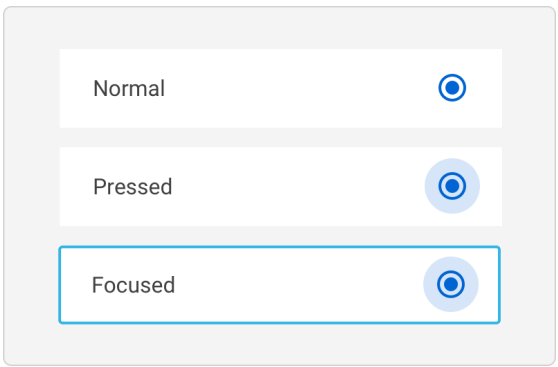
There are 6 unique states in Single Select Row.

Each row can be *Selected* or *Unselected*, and there are 3 interaction states in each row as a user interacts with it:

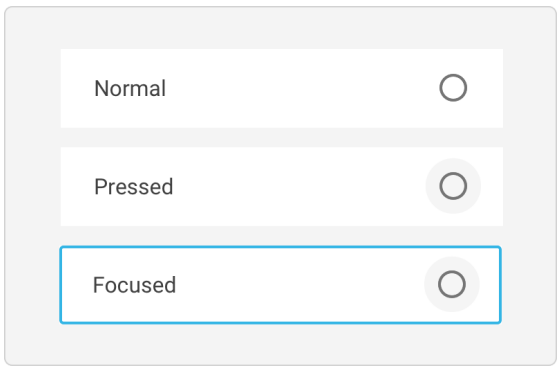
1. Normal
2. Pressed
3. Focused

Keep in mind: *Disabled state* is not supported this control. See why we don't support disabled state.

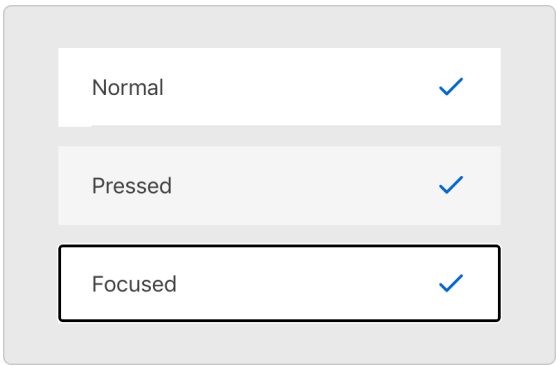
Android
Row Selected



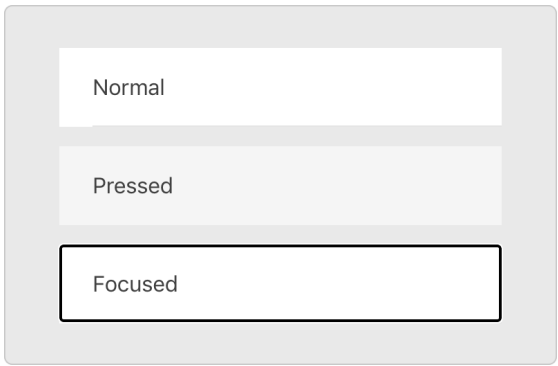
Row Unselected



iOS
Row Selected

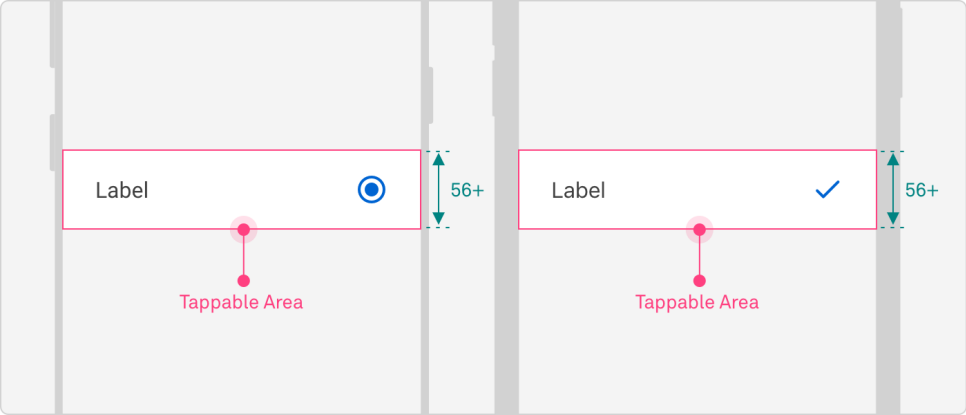


Row Unselected



Find out more details on the different states, see Interaction States.

Tappable Area



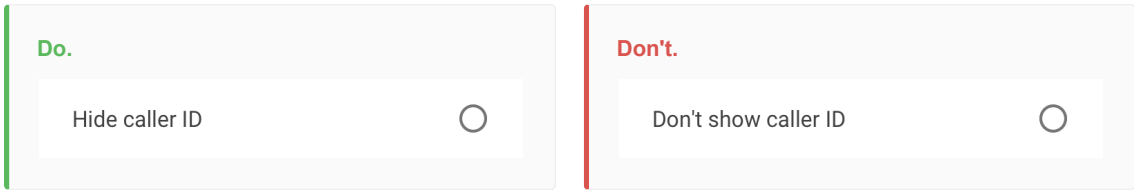
Even though the indicator is located on the right, the whole row is designed to be tappable to allow users to easily select an option on a mobile device.

It also has a minimum height of 56 (sp, pt) that allows sufficient spacing between each row.

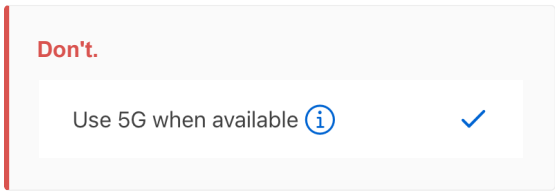
Best Practices

For each row:

- **Label options clearly based on what the option will do.**
  Have a distinct label that clearly describes what the row option represents. Don't use negative language.

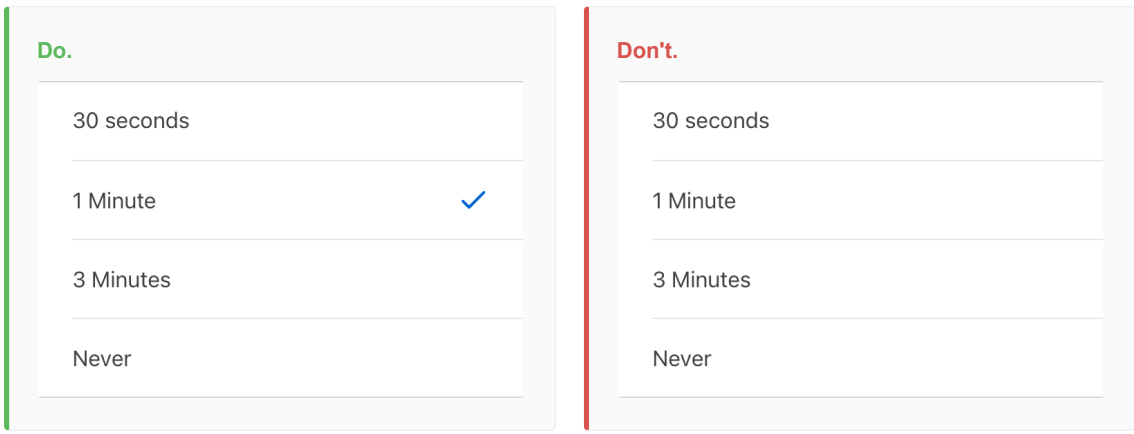


- **Don't add any other UI controls in the row.**
  The whole row acts as a giant button that allows user to select a particular option in a list. Don't add other interactive controls that will conflict with the interactions.

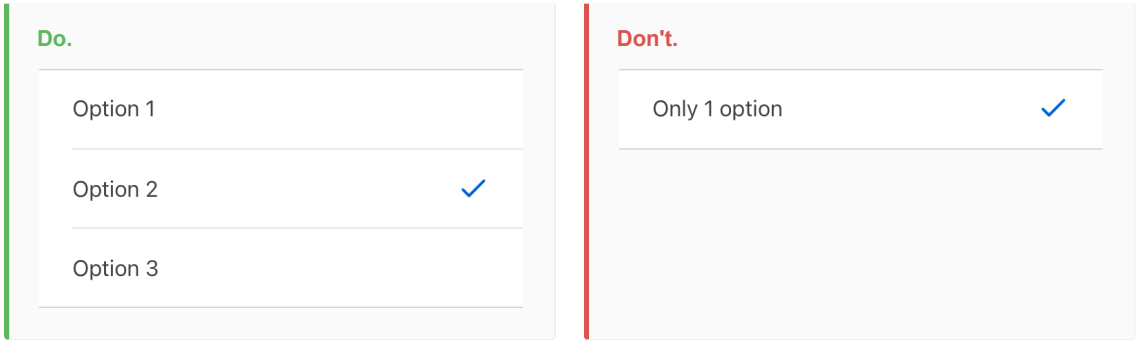


For single selection list:

- **Always have 1 option selected by default.**
  Don't leave the list unselected at any given time. Selected row acts as a visual cue to help users understand that this is a single selection control.



- **Selecting a row should deselect all other rows.**
  There should only be exactly 1 row selected at any given time. If user taps on the row that is already selected, nothing should happen.
- **In general, selecting a row applies changes immediately, there's no need for additional submit/save button.**
  When a user updates their selection in the list, it acts as a submission and there's no need add an additional save/done button to commit the changes. It should be saved on selection.
- **Don't confuse Single Select Row for multi selection function.**
  There's a significant visual difference between single and multi selection in Android and iOS so be careful to select the appropriate pattern for the required functionality.
- **Single select row should never be used alone, or be the only option in a list.**
  Nature of single selection is to always provide a user with 2 or more options to choose from.



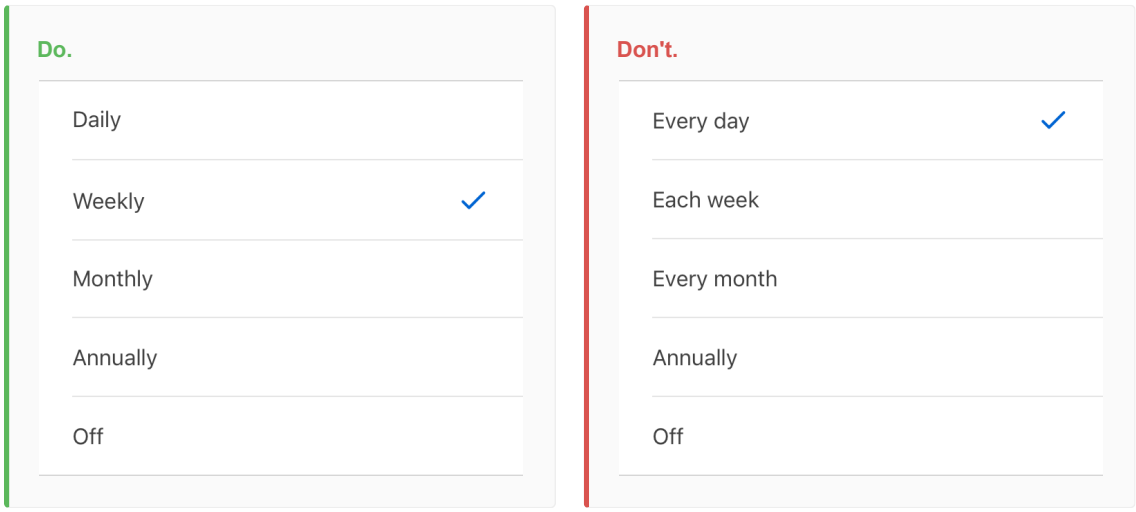
Content Guidelines

To write an effective label for a Single Select Row:

- Don't phrase the label as a question.
- Have a distinct label that indicates mutual exclusivity from other labels. Options shouldn't repeat or overlap.
- Keep label succinct and avoid sentences.
- Use sentence case.
- Not include any punctuation.

Single select rows must be considered in the context of a single select list and should:

- Describe all items in the same format for consistency (single word, phrase or sentence).
- Be ordered logically, which can be alphabetical, numerical, popularity-based, or any other clear system.



Please refer to additional content guidelines listed in Telstra's Content Style Guide.

Accessibility Considerations

Single select rows are designed to meet the WCAG 2.1 Success Criteria outlined below. All requirements should be considered and understood when using the pattern. Requirements marked with ⚠️ indicate partial compliance which must be met in build or authoring.

- 1.3.1 Info and Relationships (A) - Each single select row must contain a label
- 1.4.3 Contrast Minimum (AA) - All text meets the 4.5:1 contrast ratio
- 1.4.4 Resize Text (AA) - When resized to largest settings on the device, text is not truncated
- 1.4.11 Non Text Contrast (AA) - Aspects of the single select row required for identification meet the contrast ratio of 3:1
- 2.1.1 Keyboard (A) - Single select rows are keyboard accessible
- 2.4.3 Focus Order (A) - Single select rows follow a sequential focus order
- 2.4.6 Headings and Labels (AA) Labels are descriptive ⚠️
- 2.4.7 Focus Visible (AA) - Single select row has a clear visible focus state
- 2.5.3 Label in Name (A) - The accessible name of the single select row matches the visible label
- 2.5.5 Target Size (AAA) - The touch target size is at least 48 x 48 (dp/pt/px)
- 3.3.2 Labels or Instructions (A) - Labels and instructional text are clear and unambiguous ⚠️
- 3.4.2 Consistent Identification (AA) - Single select rows that capture the same data also contain the same label ⚠️
- 4.1.1 Parsing (A) - Single select row uses valid code
- 4.1.2 Name, Role, Value (A) - Single select control is coded to expose the correct name, role and status to assistive technology

Keyboard

- Users must be able to navigate to and interact with a single select row using keyboard alone.
- A clear visible indicator should also be present when the single select row has focus.

Screen reader

Screen reader behaviour and the ordering of announcements will vary depending on the platform/screen reader combination being used.

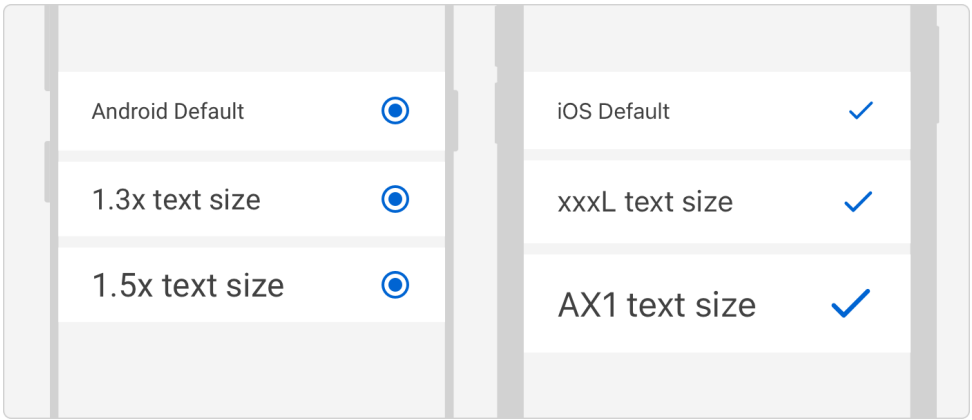
On screen reader focus, announcements must include:

- The **label**
- The **state** of the single select row if selected, ie "Ticked" and the **state** if unselected ie. "Not ticked"
- The **role** ie "radiobutton" or "button"

On toggling from unselected to selected, announcements must include:

- The selected **state** of the single select row if selected ie "Ticked" (Must)

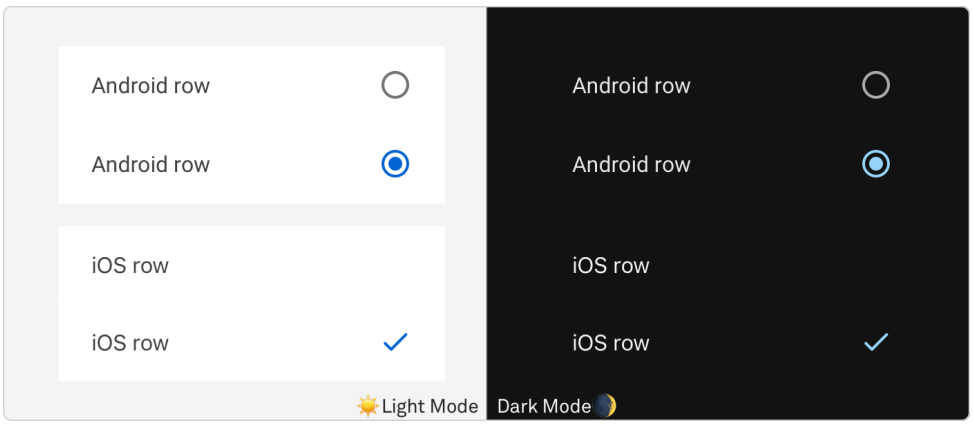
Capabilities



Robust Layout.

Components are scaled automatically based on the user's text size preferences.

(Note: The indicator on Android doesn't scale due to native control limitation.)



Dark Appearances.

Automatically update its appearance based on user's light or dark appearance settings.
