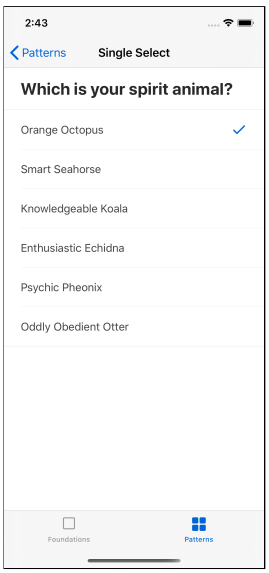
Single Select Row - iOS Dev Guide

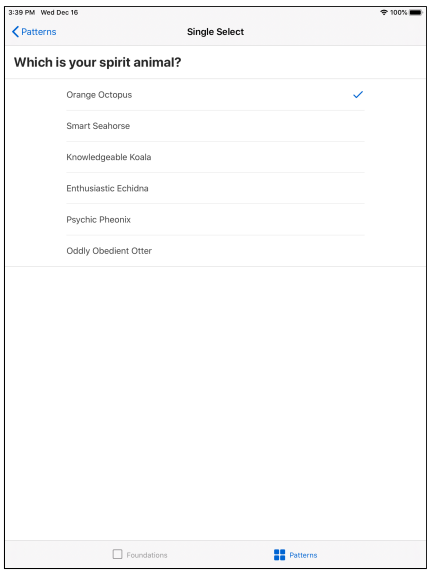
Created by Peggy Liu, last modified by Davyd Geyl on 25 Feb 2021

Used when a user can only select one option. If users are allowed to select multiple options, use a MultiSelectRow instead.

Ensure that there is a default option is selected.

Find in the catalogue app: Patterns → Single Select





Sample implementation in catalogue app

https://git02.ae.sda.corp.telstra.com/projects/ABLE/repos/able-ios-catalogue-app/browse/AbleCatalogue/Application/Application/Pattern/SingleSelect

Quick Code Reference Guide:

Creating a Single Select Row

```
//Initialise:
var singleSelectRow = SingleSelectRow()

//Set properties
singleSelectRow.labelText = "orange octopus"

//single select currently does not have an icon
```

Using a Single Select Row

```
//You can set it's "isSelected" state by using:
singleSelectRow.isSelected = true

//a variable to keep track of the selected row may be helpful
var selectedIndex: Int = 2

//In the view controller:
//Call setup where needed and define state changed handler:

singleSelectRow.setup(itemLabelText: "Orange Octopus") { state in
    //perform some action when row is selected
    // e.g. print or call method to deselect other rows
                print("Orange Octopus selected is \(state)") //state is true if selected
                self.setOthers(index: rowIndex)

             }

//sample method to deselect other rows:
private func setOthers(index: Int) {
        self.selectedIndex = index
        tableView.reloadData() //ensure you have some method to set the state of the other rows
```

```
    }
```
