A Skip Link allows keyboard users to bypass repetitive blocks of content and skip to the main content on a web page.

Usage Guidelines

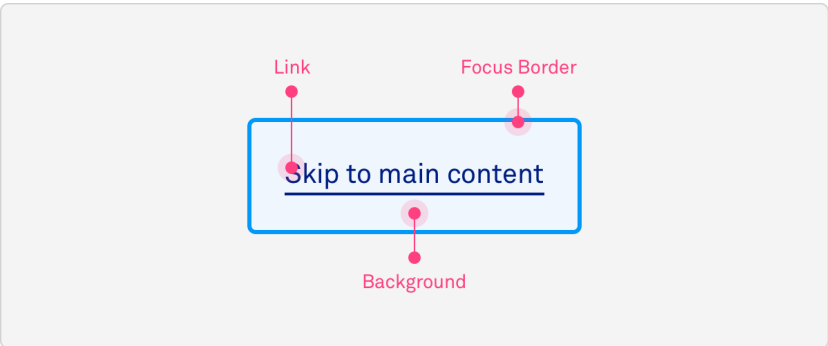
Skip Link exists to address accessibility criterion WCAG 2.4.1 Bypass Blocks and help users:

- Bypass the top-level navigation links and access the main page content faster.
- Quickly navigate to different sections of a webpage.

A web page can contain:

- One single skip link ('Skip to main content').
- Multiple skip links ('Skip to main content, sign in, footer').

Anatomy



Best Practices

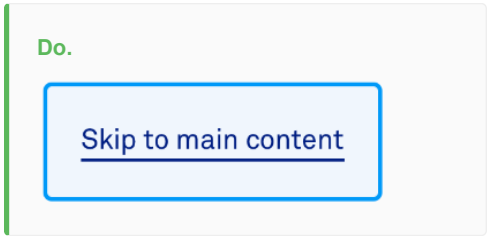
- **Skip Link should be the first link on a webpage and globally implemented across a website.**
- **Skip links remain hidden until they receive focus via the TAB key.**
- **Consider whether a web page or site needs one or multiple skip links.**
  Analyse user data to identify the commonly accessed sections of a website and provide skip links for key sections.
- **Include skip links between the opening of the `<body>` and the page `<header>`.**

- **The content that the skip links goes to is linked with an `id` and it moves the focus to the element with `tabindex="-1"`.**

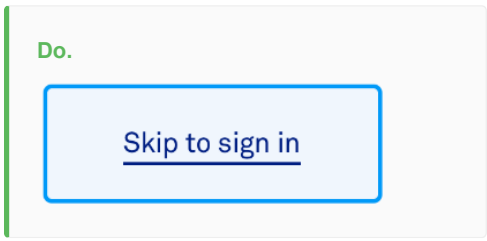
Content Guidelines

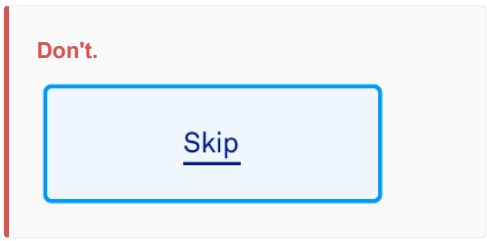
When writing the label for a Skip Link:

- Always use 'Skip to main content' for a standard global Skip Link.

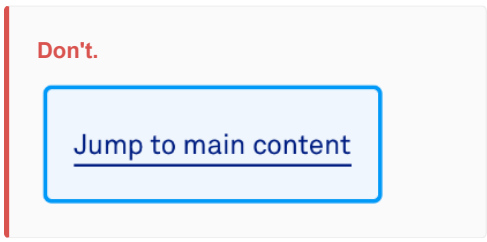


- Clearly state what content the user will be skipping to if there are multiple skip links.





- Only use the verb 'Skip' to ensure familiarity and consistency.



Please refer to additional content guidelines listed in Telstra's Content Style Guide.

Accessibility Considerations

Skip Link is a standard HTML link, so all accessibility considerations that apply for our inline links are inherited by this pattern.

In addition, when implemented on a webpage the following requirements must also be met in order to pass level A for 2.4.1 Bypass Blocks:

1. Check that a link is the first focusable control on the Web page.
2. Check that the description of the link communicates that it links to the main content.
3. Check that the link is either always visible or visible when it has keyboard focus.
4. Check that activating the link moves the focus to the main content.
5. Check that after activating the link, the keyboard focus has moved to the main content.

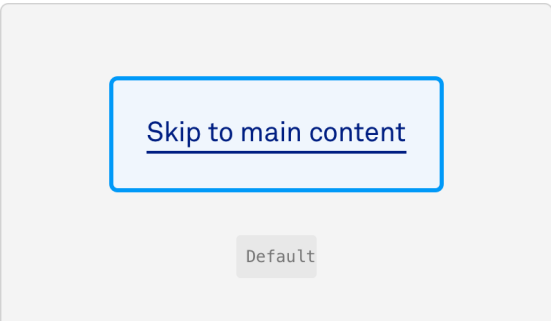
The above are outlined in the documentation for Skip links technique G1: Adding a link at the top of each page that goes directly to the main content area

---

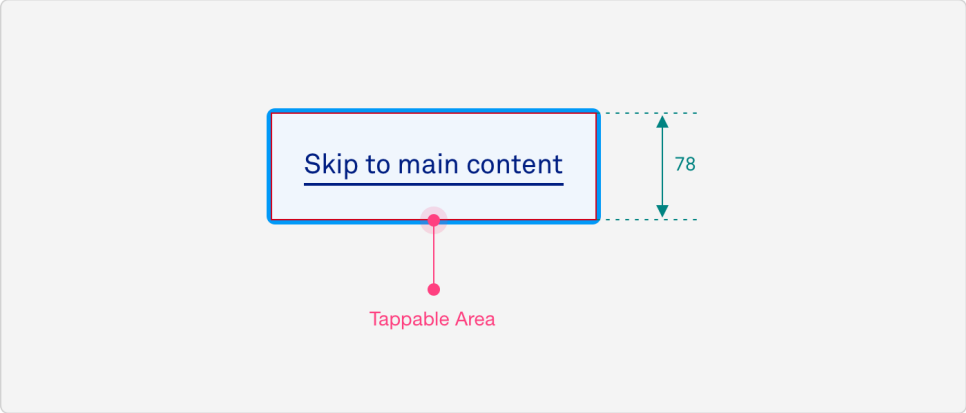
Supported States

There is 1 unique state for Skip Link. Find out more details on the different states, see Interaction States.

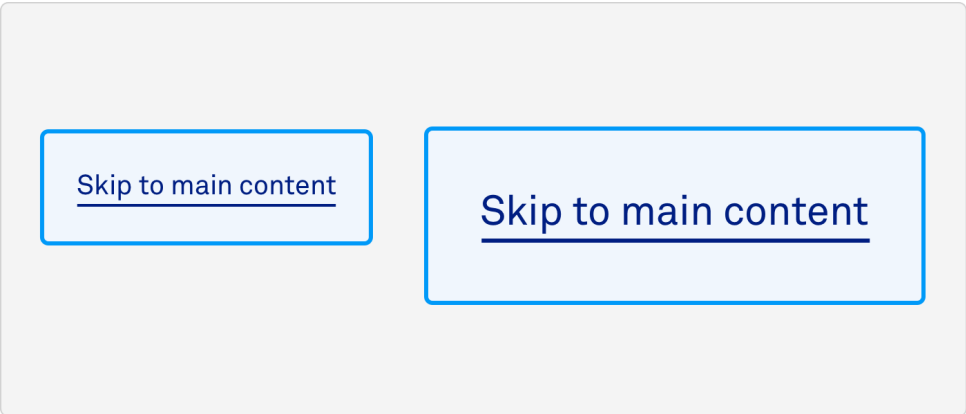
1. Focused



Interactions



Capabilities



Robust Layout.

Components are scaled automatically based on the font size and zoom level in user's browser settings.
