Text Input Helper - Contribution

Created by Genevieve Wang, last modified on 29 Sep 2020

Can't find what you're looking for?

The Design System will continue to create more types of Text Input Helper. However if there's a Text Input Helper you need that hasn't been created yet, read on about how you can help define and contribute a new Input Helper with the Able team supporting you along the way.

Process

- 1. Define New Text Input Helper Requirements
- 2. Submit Requirements for Able Review
- 3. Start Development
- 4. Move New Input Helper into Able

1. Define New Text Input Helper Requirements

Firstly, check that the Input Helper you require isn't already in our Text Input Helper library. We also recommend you contact @Genevieve Wang on which input helpers are either in development or in our backlog.

If what you need is not in progress or in our library, you can start defining the requirements of a new Input Helper by following the instructions below.

UX Designer / Business Analyst	Content Writer	Developer
1. Identify the key **text field properties**: • Define the input label and help text • Select a **Keyboard type** • Turn on **Capitalisation** • Select an **Autofill type** (if applicable) • Turn on **Autocorrect**/spellcheck 2. Define the text field **input requirements**: • What is the maximal number of characters a user can type? • What **Character set** user can type with? (e.g. digits only) 3. Define the text field **validation rules**: • Is there a minimal character length? • What error text is shown for each rule? • Does your input need additional verification checks? (e.g. ABN algorithm) 4. Define any text input **formatting** requirements: • Chunking numeric inputs with space/dash 5. **Submit** above requirements to Design System team.	*Note: Our copy library contains copy approved from the Content team for existing input helpers. These copies can be used as templates for new Text Input Helper copy.* *See more in Content Guidelines on writing copy for text fields.* 1. Define the key copy of the text field: • Label • Help text (optional) 2. Define the error text for each value validation rule	*Note: your team can proceed with development after requirements have been approved by the Able team.* Input Helper code library for: • Android • iOS Able Android lead: @Akhil Malik Able iOS lead: @Peggy Liu *Web coming soon.*

View an example of our Account Number input requirements in table format with explanations for each property row.

We recommend copying this table to your workspace and using it to document your requirements.

Pattern name	InputHelperAccountNumber	Explanation
Properties		
Label	*Account number*	Describes what text information is requested from the users.
Help Text (optional)	*This is the 13-digit number found on your bill.*	Optional instructions or guidance to user on what input they nee enter. **Label** Help text - show/hide as needed. Input value
Keyboard	*asciiNumbers*	Specifies what keyboard to display to users to ensure they input correct characters. Applicable to Android and iOS
Capitalisation	*none*	Specifies whether input will be sentence case, all or no capitalisa etc.
Autofill Type	*n/a*	Allows users to autofill certain input types from their device autof settings. Not all autofill types are available on all plat
Spellchecking	*no*	Turn on or off spellcheck dictionary suggestions as user types.

Input validation		Rules on what a user can directly input into a text field
Maximal Length	*13*	Text field will not accept more characters than specified in the m length.
Character Set	*ASCIINumbersCharacterSet*	Text field will only accept characters in the character set E.g. numbers only, letters only, certain special char
Value validation		Rules on the validity of the user's input
Rule 1		You can have multiple value validation rules E.g. minimal character length, prefix, suffix, verification algo
Type	*Minimal length*	Text field validates minimal length if a user doesn't input enough characters and leaves the field.
Length Required	*13*	Elaborate on rules for the validation type.
Error Text	*Invalid length. Account number must be 13 digits long.*	Every value validation rule should have a corresponding error te informing the user of the problem and solution.
Formatting		Some input types can be formatted into a more familiar or reada way.
Format	*Delimiter at positions 4, 9*	Define format type.
Delimiter	*Space [U+0020]*	Will input be formatted with spaces, dashes etc.
Unformatted example	*2000089896435*	Sample of format as user inputs.
Formatted example	*2000 08989 6435*	Sample of final format.

---

2. Submit Requirements for Able Review

After defining your requirements, please reach out directly to the Able team or submit a feedback form with the following input:

What would you like to tell us about?	
Type of feedback	Existing Pattern Update
Platform	None
Summary	New Input Helper: *<input name>*
Description	Provide overview of your new input helper with the attributes and rules mentioned above
Attachments	We recommend you copying the sample table and sending us a screenshot or a link to a page with the table.

A JIRA ticket will be immediately generated in our backlog and the Able team will work with you to review and verify your requirements are ready for development.

---

3. Start Development

Once your requirements have been defined and reviewed by the Able team, your team can start developing the Input Helper by referring to our existing code.

Reach out to the Able tech leads to discuss implementation. They will also help you conduct any testing and reviews.

- Android: @Akhil Malik
- iOS: @Peggy Liu
- *Web: coming soon*

---

4. Move New Input Helper into Able

Once your team has defined requirements and implemented them in code with the help of the Able team, this code can be taken from your product and built into the Able Design System so that teams across Telstra can begin to use this Text Input Helper.

Your team will also be acknowledged for contributing to the Design System!

Please reach out to @Genevieve Wang or @Tony Wang if you have any questions about the process.
